curl --location --request POST 'https://vyos/reboot' \
--form data='{ "op": "reboot", "path": ["now"] }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'

response:
{
  "success": true,
  "data": "",
  "error": null
}
```

## /poweroff

To power off the system use the poweroff endpoint.

```
curl --location --request POST 'https://vyos/poweroff' \
--form data='{ "op": "poweroff", "path": ["now"] }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'

response:
{
  "success": true,
  "data": "",
  "error": null
}
```

## /image

To add or delete an image, use the /image endpoint.

add an image

```
curl -k --location --request POST 'https://vyos/image' \
--form data='{ "op": "add", "url": "https://downloads.vyos.io/rolling/current/amd64/vyos-
rolling-latest.iso"}' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response (shorted):

```
{
  "success": true,
  "data": "Trying to fetch ISO file from https://downloads.vyos.io/rolling-latest.iso\n
        ...
        Setting up grub configuration...\nDone.\n",
  "error": null
}
```

delete an image, for example 1.3-rolling-202006070117

```
curl -k --location --request POST 'https://vyos/image' \
--form data='{ "op": "delete", "name": "1.3-rolling-202006070117"}' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response:

```
{
  "success": true,
  "data": "Deleting the \"1.3-rolling-202006070117\" image...\nDone.\n",
  "error": null
}
```

## /show

The /show endpoint is to show everything in the operational mode.

For example, show which images are installed.

```
curl -k --location --request POST 'https://vyos/show' \
--form data='{ "op": "show", "path": ["system", "image"]} ' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response:

```
{
  "success": true,
  "data": "The system currently has the following image(s) installed:\n\n
        1: 1.4-rolling-202102280559 (default boot)\n
        2: 1.4-rolling-202102230218\n
        3: 1.3-beta-202102210443\n\n",
  "error": null
}
```

## /generate

The generate endpoint run a generate command.

```
curl -k --location --request POST 'https://vyos/generate' \
--form data='{ "op": "generate", "path": ["pki", "wireguard", "key-pair"] }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response:

```
{
  "success": true,
  "data": "Private key: CFZR2eyhoVZwk4n3JFPMJx3E145f1EYgDM+ubytXYVY=\n
          Public key: jjtpPT8ycI1Q0bNtrWuxAk04k88Xwzg5VHV9xGZ58lU=\n\n",
  "error": null
}
```

## /configure

You can pass a set, delete or comment command to the /configure endpoint.

set a single command

```
curl -k --location --request POST 'https://vyos/configure' \
--form data='{ "op": "set", "path": ["interfaces", "dummy", "dum1", "address", "10.11.0.1/\n
↪32"] }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response:

```
{
  "success": true,
  "data": null,
  "error": null
}
```

delete a single command

```
curl -k --location --request POST 'https://vyos/configure' \
--form data='{ "op": "delete", "path": ["interfaces", "dummy", "dum1", "address", "10.11.\n
↪0.1/32"] }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

response:

```
{
  "success": true,
  "data": null,
  "error": null
}
```

The API pushes every request to a session and commit it. But some of VyOS components like DHCP and PPPoE Servers, IPSec, VXLAN, and other tunnels require full configuration for commit. The endpoint will process multiple commands when you pass them as a list to the data field.

```
curl -k --location --request POST 'https://vyos/configure' \
--form data='[{"op": "set", "path": ["interfaces", "vxlan", "vxlan1", "remote", "203.0.113.99
→"]}, {"op": "set", "path": ["interfaces", "vxlan", "vxlan1", "vni", "1"]}]' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

```
response:
{
  "success": true,
  "data": null,
  "error": null
}
```

### /config-file

The endpoint /config-file is to save or load a configuration.

Save a running configuration to the startup configuration. When you don't specify the file when saving, it saves to /config/config.boot.

```
curl -k --location --request POST 'https://vyos/config-file' \
--form data='{ "op": "save" }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

```
response:
{
  "success": true,
  "data": "Saving configuration to '/config/config.boot'...\nDone\n",
  "error": null
}
```

Save a running configuration to a file.

```
curl -k --location --request POST 'https://vyos/config-file' \
--form data='{ "op": "save", "file": "/config/test.config" }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

```
response:
{
  "success": true,
  "data": "Saving configuration to '/config/test.config'...\nDone\n",
  "error": null
}
```

To Load a configuration file.

```
curl -k --location --request POST 'https://vyos/config-file' \
--form data='{ "op": "load", "file": "/config/test.config" }' \
--form key='MY-HTTPS-API-PLAINTEXT-KEY'
```

```
response:
{
  "success": true,
  "data": null,
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
"error": null
}
```

## 10.2 Ansible

VyOS supports configuration via ansible. Need to install `ansible` and `python3-paramiko` module

Structure of files

```
.
├── ansible.cfg
├── files
│   └── id_rsa_docker.pub
├── hosts
└── main.yml
```

### 10.2.1 File contents

`ansible.cfg`

```
[defaults]
host_key_checking = no
retry_files_enabled = False
ANSIBLE_INVENTORY_UNPARSED_FAILED = true
```

`id_rsa_docker.pub`. Needs to declare only public key exactly.

```
AAAAB3NzaC1yc2EAAAADAQABAAQCoDgfhQJuJRFWJijHn7ZinZ3NWp4hWVrt7HFcvn0kgtP/5PeCtMt
```

`hosts`

```
[vyos_hosts]
r11 ansible_ssh_host=192.0.2.11

[vyos_hosts:vars]
ansible_python_interpreter=/usr/bin/python3
ansible_user=vyos
ansible_ssh_pass=vyos
ansible_network_os=vyos
ansible_connection=network_cli
```

`main.yml`

```
---

- hosts: r11

  connection: network_cli
  gather_facts: 'no'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

tasks:
  - name: Configure remote r11
    vyos_config:
      lines:
        - set system host-name r11
        - set system name-server 203.0.113.254
        - set service ssh disable-host-validation
        - set system login user vyos authentication public-keys docker@work type ssh-
↪rsa
        - set system login user vyos authentication public-keys docker@work key "{{

## 10.3 VyOS Terraform

### 10.3.1 Terraform for VyOS

VyOS supports development infrastructure via Terraform and provisioning via Ansible. Terraform allows you to automate the process of deploying instances on many cloud and virtual platforms. In this article, we will look at using terraforms to deploy VyOS on platforms - AWS, Azure, and vSphere. For more details about Terraform please have a look here [link](#).

Need to [install](#) Terraform

Structure of files in the standard Terraform project:

```

.
├── main.tf           # The main script
├── version.tf        # File for the changing version of Terraform.
├── variables.tf      # The file of all variables in "main.tf"
├── terraform.tfvars  # The value of all variables (passwords, login, ip addresses and
↪so on)

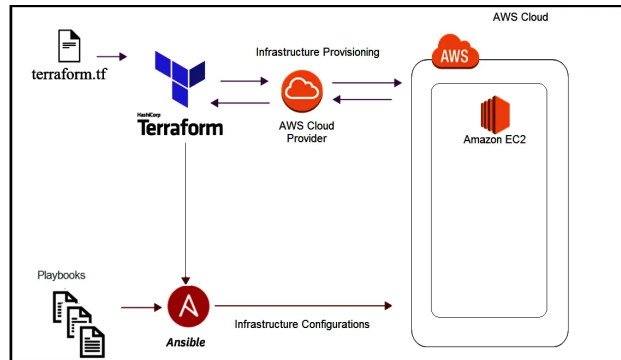

```

General commands that we will use for running Terraform scripts

```
cd /<your folder>      # go to the Terraform project
terraform init          # install all addons and provider (aws az and so on)
terraform plan          # show what is changing
terraform apply         # run script
yes                    # apply running
```

### 10.3.2 Deploying VyOS in the AWS cloud

With the help of Terraform, you can quickly deploy VyOS-based infrastructure in the AWS cloud. If necessary, the infrastructure can be removed using terraform. Also we will make provisioning using Ansible.

In this case, we'll create the necessary files for Terraform and Ansible next using Terraform we'll create a single instance on the AWS cloud and make provisioning using Ansible.

#### Preparation steps for deploying VyOS on AWS

How to create a single instance and install your configuration using Terraform+Ansible+AWS Step by step:

AWS

- 1 Create an account with AWS and get your „access\_key“, „secret key“
- 2 Create a key pair and download your .pem key

Create security group [info](#)

A security group acts as a virtual firewall for your instance to control inbound and outbound traffic. To create a new security group, complete the fields below.

**Basic details**

Security group name [info](#)

Name cannot be edited after creation.

Description [info](#)

**Edit inbound rules** [info](#)

Inbound rules control the incoming traffic that's allowed to reach the instance.

Security group rule ID	Type	Protocol	Port range	Source	Description - optional
-	All traffic	All	All	Anyw...	open all traffic

[Add rule](#)

Terraform

- 1 Create an UNIX or Windows instance
- 2 Download and install Terraform

3 Create the folder for example /root/awsterraform

```
mkdir /root/awsterraform
```

4 Copy all files into your Terraform project "/root/awsterraform" (vyos.tf, var.tf, terraform.tfvars, version.tf), more detailed see `Structure of files Terraform for AWS`\_

5 Type the commands :

```
cd /<your folder>
terraform init
```

Ansible

1 Create an UNIX instance whenever you want (local, cloud, and so on)

2 Download and install Ansible

3 Create the folder for example /root/aws/

4 Copy all files into your Ansible project „/root/aws/“ (ansible.cfg, instance.yml, mykey.pem and „all“), more detailed see *Structure of files Ansible for AWS*

mykey.pem you have to get using step 1.2

Start

Type the commands on your Terraform instance:

```
cd /<your folder>
terraform plan
terraform apply
yes
```

## Start creating an AWS instance and check the result

```
root@localhost:~/awsterraform# terraform apply
```

Terraform used the selected providers to generate the following execution plan.  
Resource actions are indicated with the following symbols:

+ create

Terraform will perform the following actions:

```
# aws_instance.myVy0Sec2 will be created
+ resource "aws_instance" "myVy0Sec2" {
  + ami                        = "ami-*****62c2d"
  + arn                      = (known after apply)
  + associate_public_ip_address = (known after apply)
  + availability_zone         = (known after apply)
  + cpu_core_count            = (known after apply)
  + cpu_threads_per_core      = (known after apply)
  + disable_api_stop          = (known after apply)

    + content_sha1      = (known after apply)
    + content_sha256    = (known after apply)
    + content_sha512    = (known after apply)
    + directory_permission = "0777"
  }

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

+ file_permission      = "0777"
+ filename             = "ip.txt"
+ id                   = (known after apply)
}

```

```

# null_resource.SSHconnection1 will be created
+ resource "null_resource" "SSHconnection1" {
  + id = (known after apply)
}

```

```

# null_resource.SSHconnection2 will be created
+ resource "null_resource" "SSHconnection2" {
  + id = (known after apply)
}

```

Plan: 4 to add, 0 to change, 0 to destroy.

Changes to Outputs:

```

+ my_IP = (known after apply)

```

Do you want to perform these actions?

Terraform will perform the actions described above.

Only 'yes' will be accepted to approve.

Enter a value: yes

null_resource.SSHconnection2: Creation complete after 1m16s [id=4902256962410024771]

Apply complete! Resources: 4 added, 0 changed, 0 destroyed.

Outputs:

my_IP = "54.xxx.xxx.xxx"

```

After executing all the commands you will have your VyOS instance on the AWS cloud with your configuration, it's a very convenient desition. If you need to delete the instance please type the command:

```
terraform destroy
```

## Troubleshooting

1 Ansible doesn't connect via SSH to your AWS instance: you have to check that your SSH key has copied into the path /root/aws/.

Also, increase the time in the file instance.yml from 300 sec to 500 sec or more. (It depends on your location). Make sure that you have opened access to the instance in the security group.

2 Terraform doesn't connect via SSH to your Ansible instance: you have to check the correct login and password in the part of the file VyOS. tf

```

connection {
  type      = "ssh"
  user      = "root"          # open root access using login and password on your_
↳Ansible
  password  = var.password    # check password in the file terraform.tfvars isn't empty
  host      = var.host        # check the correct IP address of your Ansible host
}

```

Make sure that Ansible is pinging from Terraform.

### Structure of files Terraform for AWS

```
.
├── vyos.tf                # The main script
├── var.tf                 # The file of all variables in "vyos.tf"

## 10.3.3 Deploying VyOS in the Azure cloud

With the help of Terraform, you can quickly deploy VyOS-based infrastructure in the Azure cloud. If necessary, the infrastructure can be removed using terraform. Also we will make provisioning using Ansible.

In this case, we'll create the necessary files for Terraform and Ansible next using Terraform we'll create a single instance on the Azure cloud and make provisioning using Ansible.

### Preparation steps for deploying VyOS on Azure

How to create a single instance and install your configuration using Terraform+Ansible+Azure Step by step:

Azure

- 1 Create an account with Azure

Terraform

- 1 Create an UNIX or Windows instance
- 2 Download and install Terraform
- 3 Create the folder for example /root/azvyos/

```
mkdir /root/azvyos
```

4 Copy all files into your Terraform project "/root/azvyos" (vyos.tf, var.tf, terraform.tfvars), more detailed see [`Structure of files Terraform for Azure`](#)

5 Login with Azure using the command

```
az login
```

2.6 Type the commands :

```
cd /<your folder>
terraform init
```

Ansible

1 Create an UNIX instance whenever you want (local, cloud, and so on)

2 Download and install Ansible

3 Create the folder for example /root/az/

4 Copy all files into your Ansible project „/root/az/“ (ansible.cfg, instance.yml,“all“), more detailed see [Structure of files Ansible for Azure](#)

Start

Type the commands on your Terraform instance:

```
cd /<your folder>
terraform plan
terraform apply
yes
```

After executing all the commands you will have your VyOS instance on the Azure cloud with your configuration, it's a very convenient desition. If you need to delete the instance please type the command:

```
terraform destroy
```

### Structure of files Terraform for Azure

## 10.3.4 Deploying VyOS in the vSphere infrastructure

With the help of Terraform, you can quickly deploy VyOS-based infrastructure in the vSphere. Also we will make provisioning using Ansible.

In this case, we'll create the necessary files for Terraform and Ansible next using Terraform we'll create a single instance on the vSphere cloud and make provisioning using Ansible.

### Preparation steps for deploying VyOS on vSphere

How to create a single instance and install your configuration using Terraform+Ansible+vSphere Step by step:

vSphere

- 1 Collect all data in to file „terraform.tfvars“ and create resources for example „terraform“

Terraform

- 1 Create an UNIX or Windows instance
- 2 Download and install Terraform
- 3 Create the folder for example /root/vsphereterraform

```
mkdir /root/vsphereterraform
```

- 4 Copy all files into your Terraform project "/root/vsphereterraform" (vyos.tf, var.tf, ↪ terraform.tfvars, version.tf), more detailed see `Structure of files Terraform for ↪ vSphere` \_

- 5 Type the commands :

```
cd /<your folder>
terraform init
```

Ansible

- 1 Create an UNIX instance whenever you want (local, cloud, and so on)
- 2 Download and install Ansible
- 3 Create the folder for example /root/vsphereterraform/
- 4 Copy all files into your Ansible project „/root/vsphereterraform/“ (ansible.cfg, instance.yml, „all“), more detailed see [Structure of files Ansible for vSphere](#)

Start

Type the commands on your Terraform instance:

```
cd /<your folder>
terraform plan
terraform apply
yes
```

After executing all the commands you will have your VyOS instance on the vSphere with your configuration, it's a very convenient desition. If you need to delete the instance please type the command:

```
terraform destroy
```

## 10.3.5 Deploying VyOS in the google cloud

With the help of Terraform, you can quickly deploy VyOS-based infrastructure in the google cloud. If necessary, the infrastructure can be removed using terraform. Also we will make provisioning using Ansible.

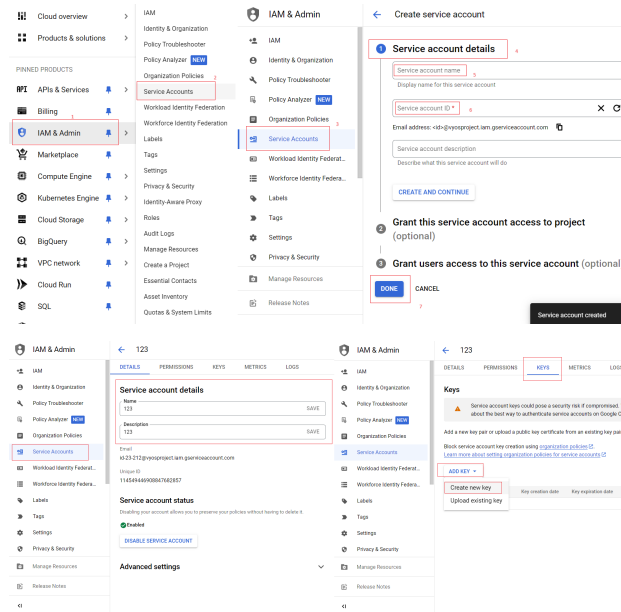

In this case, we'll create the necessary files for Terraform and Ansible next using Terraform we'll create a single instance on the google cloud and make provisioning using Ansible.

### Preparation steps for deploying VyOS on google

How to create a single instance and install your configuration using Terraform+Ansible+google Step by step:

google cloud

#### 1 Create an account with google cloud and a new project

The .JSON file download automatically after creating and will look like:

```
{
  "type": "service_account",
  "project_id": "██████████",
  "private_key_id": "██████████",
  "private_key": "-----BEGIN PRIVATE KEY
  "client_email": "██████████",
  "client_id": "██████████",
  "auth_uri": "https://accounts.google.c
  "token_uri": "https://oauth2.googleapi
  "auth_provider_x509_cert_url": "https:
  "client_x509_cert_url": "https://www.g
  "universe_domain": "googleapis.com"
```

Terraform

- 1 Create an UNIX or Windows instance
- 2 Download and install Terraform
- 3 Create the folder for example /root/google

```
mkdir /root/google
```

4 Copy all files into your Terraform project "/root/google" (vyos.tf, var.tf, terraform.tfvars, .JSON), more detailed see *Structure of files Terraform for google cloud*

5 Type the commands :

```
cd /<your folder>
terraform init
```

#### Ansible

- 1 Create an UNIX instance whenever you want (local, cloud, and so on)
- 2 Download and install Ansible
- 3 Create the folder for example /root/google/
- 4 Copy all files into your Ansible project ,/root/google/" (ansible.cfg, instance.yml, mykey.json and „all“), more detailed see *Structure of files Ansible for google cloud*

mykey.json you have to get using step 2 of the google cloud

Start

Type the commands on your Terraform instance:

```
cd /<your folder>
terraform plan
terraform apply
yes
```

### Start creating a google cloud instance and check the result

```
# terraform apply
```

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:

```
+ create
```

Terraform will perform the following actions:

```
# google_compute_firewall.tcp_22[0] will be created
+ resource "google_compute_firewall" "tcp_22" {
  + creation_timestamp = (known after apply)
  + destination_ranges = (known after apply)
  + direction          = (known after apply)
  + enable_logging      = (known after apply)
  + id                  = (known after apply)
  + name                = "vyos-tcp-22"
```

```

Plan: 6 to add, 0 to change, 0 to destroy.

Changes to Outputs:

```
+ public_ip_address = (known after apply)
```

Warning: Quoted references are deprecated

```

  on vyos.tf line 126, in resource "null_resource" "SSHconnection1":
  126:   depends_on = ["google_compute_instance.default"]

```

In this context, references are expected literally rather than in quotes. Terraform 0.11 and earlier required quotes, but quoted references are now deprecated and will be removed in a future version of Terraform. Remove the quotes surrounding this reference to silence this warning.

(and one more similar warning elsewhere)

Do you want to perform these actions?

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.

```

After executing all the commands you will have your VyOS instance on the google cloud with your configuration, it's a very convenient desition. If you need to delete the instance please type the command:

```
terraform destroy
```

## Troubleshooting

1 Increase the time in the file instance.yml from 300 sec to 500 sec or more. (It depends on your location).

Make sure that you have opened access to the instance in the security group.

2 Terraform doesn't connect via SSH to your Ansible instance: you have to check the correct login and password in the part of the file VyOS.tf

```

connection {
  type      = "ssh"
  user      = "root"          # open root access using login and password on your
↳ Ansible
  password  = var.password    # check password in the file terraform.tfvars isn't empty
  host      = var.host        # check the correct IP address of your Ansible host
}

```

Make sure that Ansible is pinging from Terraform.

## Source files for google cloud from GIT

All files about the article can be found [here](#)

## 10.4 Napalm

VyOS supports some [napalm](#) functions for configuration and op-mode. It requires more tests.

Install `napalm-vyos` module

```
apt install python3-pip
pip3 install napalm
pip3 install napalm-vyos
```

### 10.4.1 Op-mode

```
#!/usr/bin/env python3

import json
from napalm import get_network_driver

driver = get_network_driver('vyos')

vyos_router = driver(
    hostname="192.0.2.1",
    username="vyos",
    password="vyospass",
    optional_args={"port": 22},
)

vyos_router.open()
output = vyos_router.get_facts()
print(json.dumps(output, indent=4))

output = vyos_router.get_arp_table()
print(json.dumps(output, indent=4))

vyos_router.close()
```

Output op-mode

```
$ ./vyos-napalm.py
{
  "uptime": 7185,
  "vendor": "VyOS",
  "os_version": "1.3.0-rc5",
  "serial_number": "",
  "model": "Standard PC (Q35 + ICH9, 2009)",
  "hostname": "r4-1.3",
  "fqdn": "vyos.local",
  "interface_list": [
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

        "eth0",
        "eth1",
        "eth2",
        "lo",
        "vtun10"
    ]
}
[
    {
        "interface": "eth1",
        "mac": "52:54:00:b2:38:2c",
        "ip": "192.0.2.2",
        "age": 0.0
    },
    {
        "interface": "eth0",
        "mac": "52:54:00:a2:b9:5b",
        "ip": "203.0.113.11",
        "age": 0.0
    }
]

```

### 10.4.2 Configuration

We need 2 files, commands.conf and script itself.

Content of commands.conf

```

set service ssh disable-host-validation
set service ssh port '2222'
set system name-server '192.0.2.8'
set system name-server '203.0.113.8'
set interfaces ethernet eth1 description 'F00'

```

Script vyos-napalm.py

```

#!/usr/bin/env python3

from napalm import get_network_driver

driver = get_network_driver('vyos')

vyos_router = driver(
    hostname="192.0.2.1",
    username="vyos",
    password="vyospass",
    optional_args={"port": 22},
)

vyos_router.open()
vyos_router.load_merge_candidate(filename='commands.conf')
diffs = vyos_router.compare_config()

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
if bool(diffs) == True:
    print(diffs)
    vyos_router.commit_config()
else:
    print('No configuration changes to commit')
    vyos_router.discard_config()

vyos_router.close()
```

#### Output

```
$/vyos-napalm.py
[edit interfaces ethernet eth1]
+description F00
[edit service ssh]
+disable-host-validation
+port 2222
[edit system]
+name-server 192.0.2.8
+name-server 203.0.113.8
[edit]
```

## 10.5 Netmiko

VyOS supports configuration via [netmiko](#). It requires to install `python3-netmiko` module.

### 10.5.1 Example

```
#!/usr/bin/env python3

from netmiko import ConnectHandler

vyos_router = {
    "device_type": "vyos",
    "host": "192.0.2.1",
    "username": "vyos",
    "password": "vyospass",
    "port": 22,
}

net_connect = ConnectHandler(**vyos_router)

config_commands = [
    'set interfaces ethernet eth0 description WAN',
    'set interfaces ethernet eth1 description LAN',
]

# set configuration
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

output = net_connect.send_config_set(config_commands, exit_config_mode=False)
print(output)

# commit configuration
output = net_connect.commit()
print(output)

# op-mode commands
output = net_connect.send_command("run show interfaces")
print(output)

```

### Output

```

$ ./vyos-netmiko.py
configure
set interfaces ethernet eth0 description WAN
[edit]
vyos@r4-1.3# set interfaces ethernet eth1 description LAN
[edit]
vyos@r4-1.3#
commit
[edit]
vyos@r4-1.3#
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
eth0           203.0.113.1/24  u/u   WAN
eth1           192.0.2.1/30    u/u   LAN
eth2           -               u/u
lo             127.0.0.1/8     u/u
              ::1/128

[edit]

```

## 10.6 Salt

VyOS supports op-mode and configuration via [salt](#).

Without proxy it requires VyOS minion configuration and supports op-mode data:

```

set service salt-minion id 'r14'
set service salt-minion master '192.0.2.250'

```

Check salt-keys on the salt master

```

/ # salt-key --list-all
Accepted Keys:
r11
Denied Keys:
Unaccepted Keys:

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
r14
Rejected Keys:
```

Accept minion key

```
/ # salt-key --accept r14
The following keys are going to be accepted:
Unaccepted Keys:
r14
Proceed? [n/Y] y
Key for minion r14 accepted.
```

Check that salt master can communicate with minions

```
/ # salt '*' test.ping
r14:
    True
r11:
    True
```

At this step we can get some op-mode information from VyOS nodes:

```
/ # salt '*' network.interface eth0
r11:
  |_
  -----
  address:
    192.0.2.11
  broadcast:
    192.0.2.255
  label:
    eth0
  netmask:
    255.255.255.0
r14:
  |_
  -----
  address:
    192.0.2.14
  broadcast:
    192.0.2.255
  label:
    eth0
  netmask:
    255.255.255.0

/ # salt r14 network.arp
r14:
  -----
  aa:bb:cc:dd:f3:db:
    192.0.2.1
  aa:bb:cc:dd:2e:80:
```

(Fortsetzung auf der nächsten Seite)

203.0.113.1

### 10.6.1 Netmiko-proxy

It is possible to configure VyOS via `netmiko` proxy module. It requires a minion with installed `packet python3-netmiko` module who has a connection to VyOS nodes. Salt-minion have to communicate with salt master

#### Configuration

Salt master configuration:

```
/ # cat /etc/salt/master
file_roots:
  base:
    - /srv/salt/states

pillar_roots:
  base:
    - /srv/salt/pillars
```

Structure of /srv/salt:

```
/ # tree /srv/salt/
/srv/salt/
|___ pillars
|   |__ r11-proxy.sls
|   |__ top.sls
|___ states
|   |__ commands.txt
```

top.sls

```
/ # cat /srv/salt/pillars/top.sls
base:
  r11-proxy:
    - r11-proxy
```

r11-proxy.sls Includes parameters for connecting to salt-proxy minion

```
/ # cat /srv/salt/pillars/r11-proxy.sls
proxy:
  proxytype: netmiko # how to connect to proxy minion, change it
  device_type: vyos #
  host: 192.0.2.250
  username: user
  password: secret_passwd
```

commands.txt

```
/ # cat /srv/salt/states/commands.txt
set interfaces ethernet eth0 description 'WAN'
set interfaces ethernet eth1 description 'LAN'
```

Check that proxy minion is alive:

```
/ # salt r11-proxy test.ping
r11-proxy:
    True
/ #
```

## Examples

Example of op-mode:

```
/ # salt r11-proxy netmiko.send_command 'show interfaces ethernet eth0 brief' host=192.0.
↪2.14 device_type=vyos username=vyos password=vyos
r11-proxy:
  Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
  Interface      IP Address      S/L Description
  -----
  eth0           192.0.2.14/24   u/u Upstream
/ #
```

Example of configuration:

```
/ # salt r11-proxy netmiko.send_config config_commands=['set interfaces ethernet eth0
↪description Link_to_WAN'] commit=True host=192.0.2.14 device_type=vyos username=vyos
↪password=vyos
r11-proxy:
  configure
  set interfaces ethernet eth0 description Link_to_WAN
  [edit]
  vyos@r14# commit
  [edit]
  vyos@r14#
/ #
```

Example of configuration commands from the file „/srv/salt/states/commands.txt“

```
/ # salt r11-proxy netmiko.send_config config_file=salt://commands.txt commit=True
↪host=192.0.2.11 device_type=vyos username=vyos password=vyos
r11-proxy:
  configure
  set interfaces ethernet eth0 description 'WAN'
  [edit]
  vyos@r1# set interfaces ethernet eth1 description 'LAN'
  [edit]
  vyos@r1# commit
  [edit]
  vyos@r1#
/ #
```

## 10.7 Command Scripting

VyOS supports executing configuration and operational commands non-interactively from shell scripts.

To include VyOS specific functions and aliases you need to source `/opt/vyatta/etc/functions/script-template` files at the top of your script.

```
#!/bin/vbash
source /opt/vyatta/etc/functions/script-template
exit
```

### 10.7.1 Run configuration commands

Configuration commands are executed just like from a normal config session. For example, if you want to disable a BGP peer on VRRP transition to backup:

```
#!/bin/vbash
source /opt/vyatta/etc/functions/script-template
configure
set protocols bgp system-as 65536
set protocols bgp neighbor 192.168.2.1 shutdown
commit
exit
```

### 10.7.2 Run operational commands

Unlike a normal configuration session, all operational commands must be prepended with `run`, even if you haven't created a session with `configure`.

```
#!/bin/vbash
source /opt/vyatta/etc/functions/script-template
run show interfaces
exit
```

### 10.7.3 Run commands remotely

Sometimes you simply want to execute a bunch of op-mode commands via SSH on a remote VyOS system.

```
ssh 192.0.2.1 'vbash -s' <<EOF
source /opt/vyatta/etc/functions/script-template
run show interfaces
exit
EOF
```

Will return:

```
Welcome to VyOS
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

eth0	192.0.2.1/24	u/u
lo	127.0.0.1/8	u/u
	:::1/128	

### 10.7.4 Other script languages

If you want to script the configs in a language other than bash you can have your script output commands and then source them in a bash script.

Here is a simple example:

```
#!/usr/bin/env python3
print("delete firewall group address-group somehosts")
print("set firewall group address-group somehosts address '192.0.2.3'")
print("set firewall group address-group somehosts address '203.0.113.55'")
```

```
#!/bin/vbash
source /opt/vyatta/etc/functions/script-template
configure
source <(/config/scripts/setfirewallgroup.py)
commit
```

### 10.7.5 Executing Configuration Scripts

There is a pitfall when working with configuration scripts. It is tempting to call configuration scripts with „sudo“ (i.e., temporary root permissions), because that's the common way on most Linux platforms to call system commands.

On VyOS this will cause the following problem: After modifying the configuration via script like this once, it is not possible to manually modify the config anymore:

```
sudo ./myscript.sh # Modifies config
configure
set ... # Any configuration parameter
```

This will result in the following error message: `Set failed` If this happens, a reboot is required to be able to edit the config manually again.

To avoid these problems, the proper way is to call a script with the `vyattacfg` group, e.g., by using the `sg` (switch group) command:

```
sg vyattacfg -c ./myscript.sh
```

To make sure that a script is not accidentally called without the `vyattacfg` group, the script can be safeguarded like this:

```
if [ "$(id -g -n)" != 'vyattacfg' ] ; then
    exec sg vyattacfg -c "/bin/vbash $(readlink -f $0) $@"
fi
```

## 10.7.6 Executing pre-hooks/post-hooks Scripts

VyOS has the ability to run custom scripts before and after each commit

The default directories where your custom Scripts should be located are:

```
/config/scripts/commit/pre-hooks.d - Directory with scripts that run before
                                     each commit.

/config/scripts/commit/post-hooks.d - Directory with scripts that run after
                                     each commit.
```

Scripts are run in alphabetical order. Their names must consist entirely of ASCII upper- and lower-case letters, ASCII digits, ASCII underscores, and ASCII minus-hyphens. No other characters are allowed.

---

**Bemerkung:** Custom scripts are not executed with root privileges (Use sudo inside if this is necessary).

---

A simple example is shown below, where the ops command executed in the post-hook script is „show interfaces“.

```
vyos@vyos# set interfaces ethernet eth1 address 192.0.2.3/24
vyos@vyos# commit
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
eth0           198.51.100.10/24 u/u
eth1           192.0.2.3/24   u/u
eth2           -               u/u
eth3           -               u/u
lo             203.0.113.5/24 u/u
```

## 10.7.7 Preconfig on boot

The /config/scripts/vyos-preconfig-bootup.script script is called on boot before the VyOS configuration during boot process.

Any modifications were done to work around unfixed bugs and implement enhancements that are not complete in the VyOS system can be placed here.

The default file looks like this:

```
#!/bin/sh
# This script is executed at boot time before VyOS configuration is applied.
# Any modifications required to work around unfixed bugs or use
# services not available through the VyOS CLI system can be placed here.
```

### 10.7.8 Postconfig on boot

The `/config/scripts/vyos-postconfig-bootup.script` script is called on boot after the VyOS configuration is fully applied.

Any modifications were done to work around unfixed bugs and implement enhancements that are not complete in the VyOS system can be placed here.

The default file looks like this:

```
#!/bin/sh
# This script is executed at boot time after VyOS configuration is fully
# applied. Any modifications required to work around unfixed bugs or use
# services not available through the VyOS CLI system can be placed here.
```

---

**Hinweis:** For configuration/upgrade management issues, modification of this script should be the last option. Always try to find solutions based on CLI commands first.

---

## 10.8 VyOS cloud-init

Cloud and virtualized instances of VyOS are initialized using the industry-standard cloud-init. Via cloud-init, the system performs tasks such as injecting SSH keys and configuring the network. In addition, the user can supply a custom configuration at the time of instance launch.

### 10.8.1 Config Sources

VyOS support three types of config sources.

- Metadata - Metadata is sourced by the cloud platform or hypervisor. In some clouds, there is implemented as an HTTP endpoint at `http://169.254.169.254`.
- Network configuration - This config source informs the system about the network settings like IP addresses, routes, DNS. Available only in several cloud and virtualization platforms.
- User-data - User-data is specified by the user. This config source offers the ability to insert any CLI configuration commands into the configuration before the first boot.

### 10.8.2 User-data

Major cloud providers offer a means of providing user-data at the time of instance launch. It can be provided as plain text or as base64-encoded text, depending on cloud provider. Also, it can be compressed using gzip, which makes sense with a long configuration commands list, because of the hard limit to ~16384 bytes for the whole user-data.

The easiest way to configure the system via user-data is the Cloud-config syntax described below.

### 10.8.3 Cloud-config modules

In VyOS, by default, enables only two modules:

- **write\_files** - this module allows to insert any files into the filesystem before the first boot, for example, pre-generated encryption keys, certificates, or even a whole `config.boot` file. The format is described in the cloud-init documentation [Cloud-init-write\\_files](#).
- **vyos\_userdata** - the module accepts a list of CLI configuration commands in a `vyos_config_commands` section, which gives an easy way to configure the system during deployment.

### 10.8.4 cloud-config file format

A cloud-config document is written in YAML. The file must begin with `#cloud-config` line. The only supported top-level keys are `vyos_config_commands` and `write_files`. The use of these keys is described in the following two sections.

### 10.8.5 Initial Configuration

The key used to designate a VyOS configuration is `vyos_config_commands`. What follows is VyOS configuration using the „set-style“ syntax. Both „set“ and „delete“ commands are supported.

Commands requirements:

- One command per line.
- If command ends in a value, it must be inside single quotes.
- A single-quote symbol is not allowed inside command or value.

The commands list produced by the `show configuration commands` command on a VyOS router should comply with all the requirements, so it is easy to get a proper commands list by copying it from another router.

The configuration specified in the cloud-config document overwrites default configuration values and values configured via Metadata.

After the `vyos_config_commands` are executed, cloud-init will automatically perform a `commit` and `save` operation.

Here is an example cloud-config that appends configuration at the time of first boot.

```
#cloud-config
vyos_config_commands:
- set system host-name 'vyos-prod-ashburn'
- set service ntp server 1.pool.ntp.org
- set service ntp server 2.pool.ntp.org
- delete interfaces ethernet eth1 address 'dhcp'
- set interfaces ethernet eth1 address '192.0.2.247/24'
- set protocols static route 198.51.100.0/24 next-hop '192.0.2.1'
```

## System Defaults/Fallbacks

These are the VyOS defaults and fallbacks.

- SSH is configured on port 22.
- vyos/vyos credentials if no others specified by data source.
- DHCP on first Ethernet interface if no network configuration is provided.

All of these can be overridden using the configuration in user-data.

## 10.8.6 Command Execution at Initial Boot

VyOS supports the execution of operational commands and linux commands at initial boot. This is accomplished using `write_files` to certain files in the `/opt/vyatta/etc/config/scripts` directory. Commands specified in `opt/vyatta/etc/config/scripts/vyos-preconfig-bootup.script` are executed prior to configuration. The `/opt/vyatta/etc/config/scripts/vyos-postconfig-bootup.script` file contains commands to be executed after configuration. In both cases, commands are executed as the root user.

Note that the `/opt/vyatta/etc/config` is used instead of the `/config/scripts` directory referenced in the *Command Scripting* section of the documentation because the `/config/script` directory isn't mounted when the `write_files` module executes.

The following example shows how to execute commands after the initial configuration.

```
#cloud-config
write_files:
- path: /opt/vyatta/etc/config/scripts/vyos-postconfig-bootup.script
  owner: root:vyattacfg
  permissions: '0775'
  content: |
    #!/bin/vbash
    source /opt/vyatta/etc/functions/script-template
    filename=/tmp/bgp_status_`date +%Y_%m_%d_%I_%M_%p`.log
    run show ip bgp summary >> $filename
```

If you need to gather information from linux commands to configure VyOS, you can execute commands and then configure VyOS in the same script.

The following example sets the hostname based on the instance identifier obtained from the EC2 metadata service.

```
#cloud-config
write_files:
- path: /opt/vyatta/etc/config/scripts/vyos-postconfig-bootup.script
  owner: root:vyattacfg
  permissions: '0775'
  content: |
    #!/bin/vbash
    source /opt/vyatta/etc/functions/script-template
    hostname=`curl -s http://169.254.169.254/latest/meta-data/instance-id`
    configure
    set system host-name $hostname
    commit
    exit
```

### 10.8.7 NoCloud

Injecting configuration data is not limited to cloud platforms. Users can employ the NoCloud data source to inject user-data and meta-data on virtualization platforms such as VMware, Hyper-V and KVM.

While other methods exist, the most straightforward method for using the NoCloud data source is creating a seed ISO and attaching it to the virtual machine as a CD drive. The volume must be formatted as a vfat or ISO 9660 file system with the label „cidata“ or „CIDATA“.

Create text files named user-data and meta-data. On linux-based systems, the mkisofs utility can be used to create the seed ISO. The following syntax will add these files to the ISO 9660 file system.

```
mkisofs -joliet -rock -volid "cidata" -output seed.iso meta-data user-data
```

The seed.iso file can be attached to the virtual machine. As an example, the method with KVM to attach the ISO as a CD drive follows.

```
$ virt-install -n vyos_r1 \
  --ram 4096 \
  --vcpus 2 \
  --cdrom seed.iso \
  --os-type linux \
  --os-variant debian10 \
  --network network=default \
  --graphics vnc \
  --hvm \
  --virt-type kvm \
  --disk path=/var/lib/libvirt/images/vyos_kvm.qcow2,bus=virtio \
  --import \
  --noautoconsole
```

For more information on the NoCloud data source, visit its page [nocloud](#) in the cloud-init documentation.

### 10.8.8 Troubleshooting

If you encounter problems, verify that the cloud-config document contains valid YAML. Online resources such as <https://www.yamllint.com/> provide a simple tool for validating YAML.

cloud-init logs to /var/log/cloud-init.log. This file can be helpful in determining why the configuration varies from what you expect. You can fetch the most important data filtering output for vyos keyword:

```
sudo grep vyos /var/log/cloud-init.log
```

### 10.8.9 Cloud-init on Proxmox

Before starting, please refer to cloud-init [network-config-docs](#) in order to know how to import user and network configurations.

Most important keys that needs to be considered:

- VyOS configuration commands are defined in user-data file.
- Networking configurations shouldn't be passed in user-data file.

- If no networking configuration is provided, then dhcp client is going to be enabled on first interface. Bare in mind that this configuration will be injected at an OS level, so don't expect to find dhcp client configuration on vyos cli. Because of this behavior, in next example lab we will disable dhcp-client configuration on eth0.

Also, this lab considers:

- Proxmox IP address: **192.168.0.253/24**
- Storage used: volume local, which is mounted on directory **/var/lib/vz**, and contains all type of content, including snippets.
- Remove default dhcp client on first interface, and load other configuration during first boot, using cloud-init.

## Generate qcow image

A VyOS qcow image with cloud-init options is needed. This can be obtained using [vyos-vm-images](#) repo. After cloning the repo, edit the file **qemu.yml** and comment the **download-iso** role.

In this lab, we are using 1.3.0 VyOS version and setting a disk of 10G. Download VyOS .iso file and save it as **/tmp/vyos.iso**. Command used for generating qcow image:

```
sudo ansible-playbook qemu.yml -e disk_size=10 \
-e iso_local=/tmp/vyos.iso -e grub_console=serial -e vyos_version=1.3.0 \
-e cloud_init=true -e cloud_init_ds=NoCloud
```

File generated with previous command: **/tmp/vyos-1.3.0-cloud-init-10G-qemu.qcow2**

Now, that file needs to be copied to proxmox server:

```
sudo scp /tmp/vyos-1.3.0-cloud-init-10G-qemu.qcow2 root@192.168.0.253:/tmp/
```

## Prepare cloud-init files

In Proxmox server three files are going to be used for this setup:

- **network-config**: file that will indicate to avoid dhcp client on first interface.
- **user-data**: includes vyos-commands.
- **meta-data**: empty file (required).

In this lab, all files are located in **/tmp/**. So, before going on, lets move to that directory:

```
cd /tmp/
```

**user-data** file must start with **#cloud-config** and contains vyos-commands. For example:

```
#cloud-config
vyos_config_commands:
- set system host-name 'vyos-BRAS'
- set service ntp server 1.pool.ntp.org
- set service ntp server 2.pool.ntp.org
- delete interfaces ethernet eth0 address 'dhcp'
- set interfaces ethernet eth0 address '198.51.100.2/30'
- set interfaces ethernet eth0 description 'WAN - ISP01'
- set interfaces ethernet eth1 address '192.168.25.1/24'
- set interfaces ethernet eth1 description 'Comming through VLAN 25'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
- set interfaces ethernet eth2 address '192.168.26.1/24'
- set interfaces ethernet eth2 description 'Comming through VLAN 26'
- set protocols static route 0.0.0.0/0 next-hop '198.51.100.1'
```

**network-config** file only has configuration that disables the automatic dhcp client on first interface.

Content of network-config file:

```
version: 2
ethernets:
  eth0:
    dhcp4: false
    dhcp6: false
```

Finally, file **meta-data** has no content, but it's required.

### Create seed.iso

Once the three files were created, it's time to generate the **seed.iso** image, which needs to be mounted to the new VM as a cd.

Command for generating **seed.iso**

```
mkisofs -joliect -rock -volid "cidata" -output seed.iso meta-data \
user-data network-config
```

**NOTE:** be careful while copying and pasting previous commands. Double quotes may need to be corrected.

### Creating the VM

Notes for this particular example, that may need to be modified in other setups:

- VM ID: in this example, VM ID used is 555.
- VM Storage: local volume is used.
- ISO files storage: local volume is used for .iso file storage. In this scenario local volume type is set to **directory**, abd attached to /var/lib/vz.
- VM Resources: these parameters can be modified as needed.

**seed.iso** was previously created in directory /tmp/. It's necessary to move it to /var/lib/vz/template/iso

```
mv /tmp/seed.iso /var/lib/vz/template/iso/
```

On proxmox server:

```
## Create VM, import disk and define boot order
qm create 555 --name vyos-1.3.0-cloudinit --memory 1024 --net0 virtio,bridge=vbr0
qm importdisk 555 vyos-1.3.0-cloud-init-10G-qemu.qcow2 local
qm set 555 --virtio0 local:555/vm-555-disk-0.raw
qm set 555 --boot order=virtio0

## Import seed.iso for cloud init
qm set 555 --ide2 media=cdrom,file=local:iso/seed.iso
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
## Since this server has 1 nic, lets add network interfaces (vlan 25 and 26)
qm set 555 --net1 virtio,bridge=vmbr0,firewall=1,tag=25
qm set 555 --net2 virtio,bridge=vmbr0,firewall=1,tag=26
```

## Power on VM and verifications

From cli or GUI, power on VM, and after it boots, verify configuration

## References

- VyOS [cloud-init-docs](#).

- Proxmox [Cloud-init-Support](#).

## 10.9 pyvyos

pyvyos is a Python library designed for interacting with VyOS devices through their API. This documentation is intended to guide you in using pyvyos for programmatic management of your VyOS devices.

- [pyvyos Documentation on Read the Docs](#) provides detailed instructions on the installation, configuration, and operation of the pyvyos library.
- [pyvyos Source Code on GitHub](#) allows you to access and contribute to the library's code.
- [pyvyos on PyPI](#) for easy installation via pip, the Python package installer. Execute *pip install pyvyos* in your terminal to install.

### 10.9.1 Installation

You can install pyvyos using pip:

```
pip install pyvyos
```

### 10.9.2 Getting Started

### 10.9.3 Importing and Disabling Warnings for verify=False

```
import urllib3
urllib3.disable_warnings()
```

## 10.9.4 Using API Response Class

```
@dataclass
class ApiResponse:
    status: int
    request: dict
    result: dict
    error: str
```

## 10.9.5 Initializing a VyDevice Object

```
from dotenv import load_dotenv
load_dotenv()

hostname = os.getenv('VYDEVICE_HOSTNAME')
apikey = os.getenv('VYDEVICE_APIKEY')
port = os.getenv('VYDEVICE_PORT')
protocol = os.getenv('VYDEVICE_PROTOCOL')
verify_ssl = os.getenv('VYDEVICE_VERIFY_SSL')

verify = verify_ssl.lower() == "true" if verify_ssl else True

device = VyDevice(hostname=hostname, apikey=apikey, port=port, protocol=protocol,
↪ verify=verify)
```

## 10.9.6 Using pyvyos

### Configure, then Set

```
response = device.configure_set(path=["interfaces", "ethernet", "eth0", "address", "192.
↪ 168.1.1/24"])
if not response.error:
    print(response.result)
```

### Configure, then Show a Single Object Value

```
response = device.retrieve_return_values(path=["interfaces", "dummy", "dum1", "address"])
print(response.result)
```

### Configure, then Show Object

```
response = device.retrieve_show_config(path=[])
if not response.error:
    print(response.result)
```

### Configure, then Delete Object

```
response = device.configure_delete(path=["interfaces", "dummy", "dum1"])
```

### Configure, then Save

```
response = device.config_file_save()
```

## 10.9.7 Configure, then Save File

```
response = device.config_file_save(file="/config/test300.config")
```

### Show Object

```
response = device.show(path=["system", "image"])
print(response.result)
```

### Generate Object

```
randstring = ''.join(random.choice(string.ascii_letters + string.digits) for _ in
↳ range(20))
keyrand = f'/tmp/key_{randstring}'
response = device.generate(path=["ssh", "client-key", keyrand])
```

### Reset Object

```
response = device.reset(path=["conntrack-sync", "internal-cache"])
if not response.error:
    print(response.result)
```

### Configure, then Load File

```
response = device.config_file_load(file="/config/test300.config")
```

Sometimes things break or don't work as expected. This section describes several troubleshooting tools provided by VyOS that can help when something goes wrong.

## 11.1 Connectivity Tests

### 11.1.1 Basic Connectivity Tests

Verifying connectivity can be done with the familiar *ping* and *traceroute* commands. The options for each are shown (the options for each command were displayed using the built-in help as described in the [Command Line Interface](#) section and are omitted from the output here):

#### **ping <destination>**

Send ICMP echo requests to destination host. There are multiple options to ping, inkl. VRF support.

```
vyos@vyos:~$ ping 10.1.1.1
Possible completions:
  <Enter>      Execute the current command
  adaptive     Ping options
  allow-broadcast
  audible
  bypass-route
  count
  deadline
  do-not-fragment
  flood
  interface
  interval
  mark
  no-loopback
  numeric
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

pattern
quiet
record-route
size
timestamp
tos
ttl
verbose
vrf

```

**traceroute <destination>**

Trace path to target.

```

vyos@vyos:~$ traceroute
Possible completions:
<hostname>      Track network path to specified node
<x.x.x.x>
<h:h:h:h:h:h:h>
ipv4            Track network path to <hostname|IPv4 address>
ipv6            Track network path to <hostname|IPv6 address>

```

**11.1.2 Advanced Connectivity Tests****monitor traceroute <destination>**

However, another helper is available which combines ping and traceroute into a single tool. An example of its output is shown:

```

vyos@vyos:~$ mtr 10.62.212.12

                My traceroute  [v0.85]
vyos (0.0.0.0)
Keys:  Help   Display mode   Restart statistics   Order of fields   quit
              Packets                Pings
Host                Loss%   Snt   Last   Avg   Best  Wrst  StDev
1. 10.11.110.4       0.0%    34    0.5    0.5   0.4   0.8   0.1
2. 10.62.255.184     0.0%    34    1.1    1.0   0.9   1.4   0.1
3. 10.62.255.71      0.0%    34    1.4    1.4   1.3   2.0   0.1
4. 10.62.212.12      0.0%    34    1.6    1.6   1.6   1.7   0.0

```

---

**Bemerkung:** The output consumes the screen and will replace your command prompt.

---

Several options are available for changing the display output. Press *h* to invoke the built in help system. To quit, just press *q* and you'll be returned to the VyOS command prompt.

### 11.1.3 IPv6 Topology Discovery

IPv6 uses different techniques to discover its Neighbors/topology.

#### Router Discovery

**force ipv6-rd interface <interface> [address <ipv6-address>]**

Discover routers via eth0.

Example:

```
vyos@vyos:~$ force ipv6-rd interface eth0
Soliciting ff02::2 (ff02::2) on eth0...

Hop limit           :           60 (      0x3c)
Stateful address conf. :           No
Stateful other conf.  :           No
Mobile home agent    :           No
Router preference     :          high
Neighbor discovery proxy :           No
Router lifetime       :       1800 (0x00000708) seconds
Reachable time        : unspecified (0x00000000)
Retransmit time       : unspecified (0x00000000)
Prefix               : 240e:fe:8ca7:ea01::/64
  On-link             :           Yes
  Autonomous address conf.:         Yes
  Valid time          :    2592000 (0x00278d00) seconds
  Pref. time          :       14400 (0x00003840) seconds
Prefix               : fc00:470:f1cd:101::/64
  On-link             :           Yes
  Autonomous address conf.:         Yes
  Valid time          :    2592000 (0x00278d00) seconds
  Pref. time          :       14400 (0x00003840) seconds
Recursive DNS server   : fc00:470:f1cd::ff00
DNS server lifetime    :         600 (0x00000258) seconds
Source link-layer address: 00:98:2B:F8:3F:11
from fe80::298:2bff:fe8:3f11
```

#### Neighbor Discovery

**force ipv6-nd interface <interface> address <ipv6-address>**

Example:

```
vyos@vyos:~$ force ipv6-nd interface eth0 address fc00:470:f1cd:101::1

Soliciting fc00:470:f1cd:101::1 (fc00:470:f1cd:101::1) on eth0...
Target link-layer address: 00:98:2B:F8:3F:11 from fc00:470:f1cd:101::1
```

## 11.2 Interface names

If you find the names of your interfaces have changed, this could be because your MAC addresses have changed.

- For example, you have a VyOS VM with 4 Ethernet interfaces named eth0, eth1, eth2 and eth3. Then, you migrate your VyOS VM to a different host and find your interfaces now are eth4, eth5, eth6 and eth7.

One way to fix this issue **taking control of the MAC addresses** is:

Log into VyOS and run this command to display your interface settings.

```
show interfaces detail
```

Take note of MAC addresses.

Now, in order to update a MAC address in the configuration, run this command specifying the interface name and MAC address you want.

```
set interfaces eth0 hw-id 00:0c:29:da:a4:fe
```

If it is a VM, go into the settings of the host and set the MAC address to the settings found in the config.boot file. You can also set the MAC to static if the host allows so.

- Another example could be when cloning VyOS VMs in GNS3 and you get into the same issue: interface names have changed.

And **a more generic way to fix it** is just deleting every MAC address at the configuration file of the cloned machine. They will be correctly regenerated automatically.

## 11.3 Monitoring

VyOS features several monitoring tools.

```
vyos@vyos:~$ monitor
Possible completions:
bandwidth      Monitor interface bandwidth in real time
bandwidth-test  Initiate or wait for bandwidth test
cluster        Monitor clustering service
command        Monitor an operational mode command (refreshes every 2 seconds)
conntrack-sync Monitor conntrack-sync
content-inspection
                Monitor Content-Inspection
dhcp           Monitor Dynamic Host Control Protocol (DHCP)
dns            Monitor a Domain Name Service (DNS) daemon
firewall       Monitor Firewall
https          Monitor the Secure Hypertext Transfer Protocol (HTTPS) service
lldp           Monitor Link Layer Discovery Protocol (LLDP) daemon
log            Monitor last lines of messages file
nat            Monitor network address translation (NAT)
ndp            Monitor the NDP information received by the router through the device
openvpn        Monitor OpenVPN
protocol       Monitor routing protocols
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

snmp	Monitor Simple Network Management Protocol (SNMP) daemon
stop-all	Stop all current background monitoring processes
traceroute	Monitor the path to a destination in realtime
traffic	Monitor traffic dumps
vpn	Monitor VPN
vrrp	Monitor Virtual Router Redundancy Protocol (VRRP)
webproxy	Monitor Webproxy service

### 11.3.1 Traffic Dumps

To monitor interface traffic, issue the `monitor traffic interface <name>` command, replacing `<name>` with your chosen interface.

```
vyos@vyos:~$ monitor traffic interface eth0
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on eth0, link-type EN10MB (Ethernet), capture size 262144 bytes
15:54:28.581601 IP 192.168.0.1 > vyos: ICMP echo request, id 1870, seq 3848, length 64
15:54:28.581660 IP vyos > 192.168.0.1: ICMP echo reply, id 1870, seq 3848, length 64
15:54:29.583399 IP 192.168.0.1 > vyos: ICMP echo request, id 1870, seq 3849, length 64
15:54:29.583454 IP vyos > 192.168.0.1: ICMP echo reply, id 1870, seq 3849, length 64
^C
4 packets captured
4 packets received by filter
0 packets dropped by kernel
vyos@vyos:~$
```

To quit monitoring, press *Ctrl-c* and you'll be returned to the VyOS command prompt.

Traffic can be filtered and saved.

```
vyos@vyos:~$ monitor traffic interface eth0
Possible completions:
<Enter>      Execute the current command
filter       Monitor traffic matching filter conditions
save         Save traffic dump from an interface to a file
```

### 11.3.2 Interface Bandwidth Usage

to take a quick view on the used bandwidth of an interface use the `monitor bandwidth` command

```
vyos@vyos:~$ monitor bandwidth interface eth0
```

show the following:

B	(RX Bytes/second)
198.00	.   . . . .   . . . . .
165.00	.   . . . .   . . . . .
132.00	. .   .   . . . . .
99.00	. .   .   . . . . .
66.00	.   . . . . .
33.00	.   . . . . .

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

### 11.3.3 Interface Performance

To take a look on the network bandwidth between two nodes, the `monitor bandwidth-test` command is used to run iperf.

```
vyos@vyos:~$ monitor bandwidth-test
Possible completions:
  accept      Wait for bandwidth test connections (port TCP/5001)
  initiate    Initiate a bandwidth test
```

- The `accept` command opens a listening iperf server on TCP Port 5001
- The `initiate` command connects to that server to perform the test.

```
vyos@vyos:~$ monitor bandwidth-test initiate
Possible completions:
<hostname>   Initiate a bandwidth test to specified host (port TCP/5001)
<x.x.x.x>
<h:h:h:h:h:h:h>
```

### 11.3.4 Monitor command

The `monitor command` command allows you to repeatedly run a command to view a continuously refreshed output. The command is run and output every 2 seconds, allowing you to monitor the output continuously without having to re-run the command. This can be useful to follow routing adjacency formation.

```
vyos@router:~$ monitor command "show interfaces"
```

Will clear the screen and show you the output of `show interfaces` every 2 seconds.

```
Every 2.0s: /opt/vyatta/bin/vyatta-op-cmd-wrapper    Sun Mar 26 02:49:46 2019

Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
eth0           192.168.1.1/24  u/u
eth0.5         198.51.100.4/24 u/u  WAN
lo             127.0.0.1/8    u/u
::1/128
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

vti0	172.25.254.2/30	u/u
vti1	172.25.254.9/30	u/u

## 11.4 Terminal/Console

Sometimes you need to clear counters or statistics to troubleshoot better.

To do this use the `clear` command in Operational mode.

to clear the console output

```
vyos@vyos:~$ clear console
```

to clear interface counters

```
# clear all interfaces
vyos@vyos:~$ clear interface ethernet counters
# clear specific interface
vyos@vyos:~$ clear interface ethernet eth0 counters
```

The command follow the same logic as the `set` command in configuration mode.

```
# clear all counters of a interface type
vyos@vyos:~$ clear interface <interface_type> counters
# clear counter of a interface in interface_type
vyos@vyos:~$ clear interface <interface_type> <interface_name> counters
```

to clear counters on firewall rulesets or single rules

```
vyos@vyos:~$ clear firewall name <ipv4 ruleset name> counters
vyos@vyos:~$ clear firewall name <ipv4 ruleset name> rule <rule#> counters

vyos@vyos:~$ clear firewall ipv6-name <ipv6 ruleset name> counters
vyos@vyos:~$ clear firewall ipv6-name <ipv6 ruleset name> rule <rule#> counters
```

## 11.5 System Information

### 11.5.1 Boot Steps

VyOS 1.2 uses [Debian Jessie](#) as the base Linux operating system. Jessie was the first version of Debian that uses [systemd](#) as the default init system.

These are the boot steps for VyOS 1.2

1. The BIOS loads Grub (or isolinux for the Live CD)
2. Grub then starts the Linux boot and loads the Linux Kernel `/boot/vmlinuz`
3. Kernel Launches Systemd `/lib/systemd/systemd`
4. Systemd loads the VyOS service file `/lib/systemd/system/vyos-router.service`

5. The service file launches the VyOS router init script `/usr/libexec/vyos/init/vyos-router` - this is part of the `vyatta-cfg` Debian package
  1. Starts `FRR` - successor to `GNU Zebra` and `Quagga`
  2. Initialises the boot configuration file - copies over `config.boot.default` if there is no configuration
  3. Runs the configuration migration, if the configuration is for an older version of VyOS
  4. Runs The pre-config script, if there is one `/config/scripts/vyos-preconfig-bootup.script`
  5. If the config file was upgraded, runs any post upgrade scripts `/config/scripts/post-upgrade.d`
  6. Starts `rl-system` and `firewall`
  7. Mounts the `/boot` partition
  8. The boot configuration file is then applied by `/opt/vyatta/sbin/vyatta-boot-config-loader/opt/vyatta/etc/config/config.boot`
    1. The config loader script writes log entries to `/var/log/vyatta-config-loader.log`
  9. Runs `telinit q` to tell the init system to reload `/etc/inittab`
  10. Finally it runs the post-config script `/config/scripts/vyos-postconfig-bootup.script`

---

## Configuration Blueprints

---

This chapter contains various configuration examples:

### 12.1 Zone-Policy example

---

**Bemerkung:** Starting from VyOS 1.4-rolling-202308040557, a new firewall structure can be found on all vyos installations, and zone based firewall is no longer supported. Documentation for most of the new firewall CLI can be found in the [firewall](#) chapter. The legacy firewall is still available for versions before 1.4-rolling-202308040557 and can be found in the firewall-legacy chapter. The examples in this section use the legacy firewall configuration commands, since this feature has been removed in earlier releases.

---

---

**Bemerkung:** In T2199 the syntax of the zone configuration was changed. The zone configuration moved from `zone-policy zone <name>` to `firewall zone <name>`.

---

#### 12.1.1 Native IPv4 and IPv6

We have three networks.

```
WAN - 172.16.10.0/24, 2001:0DB8:0:9999::0/64
LAN - 192.168.100.0/24, 2001:0DB8:0:AAAA::0/64
DMZ - 192.168.200.0/24, 2001:0DB8:0:BBBB::0/64
```

**This specific example is for a router on a stick, but is very easily adapted for however many NICs you have:**

- Internet - 192.168.200.100 - TCP/80
- Internet - 192.168.200.100 - TCP/443
- Internet - 192.168.200.100 - TCP/25

- Internet - 192.168.200.100 - TCP/53
- VyOS acts as DHCP, DNS forwarder, NAT, router and firewall.
- 192.168.200.200/2001:0DB8:0:BBBB::200 is an internal/external DNS, web and mail (SMTP/IMAP) server.
- 192.168.100.10/2001:0DB8:0:AAAA::10 is the administrator's console. It can SSH to VyOS.
- LAN and DMZ hosts have basic outbound access: Web, FTP, SSH.
- LAN can access DMZ resources.
- DMZ cannot access LAN resources.
- Inbound WAN connect to DMZ host.

## Logical

## Physical

The VyOS interface is assigned the .1/:1 address of their respective networks. WAN is on VLAN 10, LAN on VLAN 20, and DMZ on VLAN 30.

It will look something like this:

```

interfaces {
    ethernet eth0 {
        duplex auto
        hw-id 00:53:ed:6e:2a:92
        smp_affinity auto
        speed auto
        vif 10 {
            address 172.16.10.1/24
            address 2001:db8:0:9999::1/64
        }
        vif 20 {
            address 192.168.100.1/24
            address 2001:db8:0:AAAA::1/64
        }
        vif 30 {
            address 192.168.200.1/24
            address 2001:db8:0:BBBB::1/64
        }
    }
    loopback lo {
    }
}

```

### 12.1.2 Zones Basics

Each interface is assigned to a zone. The interface can be physical or virtual such as tunnels (VPN, PPTP, GRE, etc) and are treated exactly the same.

Traffic flows from zone A to zone B. That flow is what I refer to as a zone-pair-direction. eg. A->B and B->A are two zone-pair-destinations.

Rulesets are created per zone-pair-direction.

I name rule sets to indicate which zone-pair-direction they represent. eg. ZoneA-ZoneB or ZoneB-ZoneA. LAN-DMZ, DMZ-LAN.

In VyOS, you have to have unique Ruleset names. In the event of overlap, I add a „-6“ to the end of v6 rulesets. eg. LAN-DMZ, LAN-DMZ-6. This allows for each auto-completion and uniqueness.

In this example we have 4 zones. LAN, WAN, DMZ, Local. The local zone is the firewall itself.

If your computer is on the LAN and you need to SSH into your VyOS box, you would need a rule to allow it in the LAN-Local ruleset. If you want to access a webpage from your VyOS box, you need a rule to allow it in the Local-LAN ruleset.

In rules, it is good to keep them named consistently. As the number of rules you have grows, the more consistency you have, the easier your life will be.

```

Rule 1 - State Established, Related
Rule 2 - State Invalid
Rule 100 - ICMP
Rule 200 - Web
Rule 300 - FTP
Rule 400 - NTP
Rule 500 - SMTP

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
Rule 600 - DNS
Rule 700 - DHCP
Rule 800 - SSH
Rule 900 - IMAPS
```

The first two rules are to deal with the idiosyncrasies of VyOS and iptables.

Zones and Rulesets both have a default action statement. When using Zone-Policies, the default action is set by the zone-policy statement and is represented by rule 10000.

It is good practice to log both accepted and denied traffic. It can save you significant headaches when trying to troubleshoot a connectivity issue.

To add logging to the default rule, do:

```
set firewall name <ruleSet> default-log
```

By default, iptables does not allow traffic for established sessions to return, so you must explicitly allow this. I do this by adding two rules to every ruleset. 1 allows established and related state packets through and rule 2 drops and logs invalid state packets. We place the established/related rule at the top because the vast majority of traffic on a network is established and the invalid rule to prevent invalid state packets from mistakenly being matched against other rules. Having the most matched rule listed first reduces CPU load in high volume environments. Note: I have filed a bug to have this added as a default action as well.

, ‘It is important to note, that you do not want to add logging to the established state rule as you will be logging both the inbound and outbound packets for each session instead of just the initiation of the session. Your logs will be massive in a very short period of time.’

In VyOS you must have the interfaces created before you can apply it to the zone and the rulesets must be created prior to applying it to a zone-policy.

I create/configure the interfaces first. Build out the rulesets for each zone-pair-direction which includes at least the three state rules. Then I setup the zone-policies.

Zones do not allow for a default action of accept; either drop or reject. It is important to remember this because if you apply an interface to a zone and commit, any active connections will be dropped. Specifically, if you are SSH'd into VyOS and add local or the interface you are connecting through to a zone and do not have rulesets in place to allow SSH and established sessions, you will not be able to connect.

The following are the rules that were created for this example (may not be complete), both in IPv4 and IPv6. If there is no IP specified, then the source/destination address is not explicit.

```
WAN - DMZ:192.168.200.200 - tcp/80
WAN - DMZ:192.168.200.200 - tcp/443
WAN - DMZ:192.168.200.200 - tcp/25
WAN - DMZ:192.168.200.200 - tcp/53
WAN - DMZ:2001:0DB8:0:BBBB::200 - tcp/80
WAN - DMZ:2001:0DB8:0:BBBB::200 - tcp/443
WAN - DMZ:2001:0DB8:0:BBBB::200 - tcp/25
WAN - DMZ:2001:0DB8:0:BBBB::200 - tcp/53

DMZ - Local - tcp/53
DMZ - Local - tcp/123
DMZ - Local - tcp/67,68

LAN - Local - tcp/53
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

LAN - Local - tcp/123
LAN - Local - tcp/67,68
LAN:192.168.100.10 - Local - tcp/22
LAN:2001:0DB8:0:AAAA::10 - Local - tcp/22

LAN - WAN - tcp/80
LAN - WAN - tcp/443
LAN - WAN - tcp/22
LAN - WAN - tcp/20,21

DMZ - WAN - tcp/80
DMZ - WAN - tcp/443
DMZ - WAN - tcp/22
DMZ - WAN - tcp/20,21
DMZ - WAN - tcp/53
DMZ - WAN - udp/53

Local - WAN - tcp/80
Local - WAN - tcp/443
Local - WAN - tcp/20,21

Local - DMZ - tcp/25
Local - DMZ - tcp/67,68
Local - DMZ - tcp/53
Local - DMZ - udp/53

Local - LAN - tcp/67,68

LAN - DMZ - tcp/80
LAN - DMZ - tcp/443
LAN - DMZ - tcp/993
LAN:2001:0DB8:0:AAAA::10 - DMZ:2001:0DB8:0:BBBB::200 - tcp/22
LAN:192.168.100.10 - DMZ:192.168.200.200 - tcp/22

```

Since we have 4 zones, we need to setup the following rulesets.

```

Lan-wan
Lan-local
Lan-dmz
Wan-lan
Wan-local
Wan-dmz
Local-lan
Local-wan
Local-dmz
Dmz-lan
Dmz-wan
Dmz-local

```

Even if the two zones will never communicate, it is a good idea to create the zone-pair-direction rulesets and set default-log. This will allow you to log attempts to access the networks. Without it, you will never see the connection attempts.

This is an example of the three base rules.

```

name wan-lan {
  default-action drop
  default-log
  rule 1 {
    action accept
    state {
      established enable
      related enable
    }
  }
  rule 2 {
    action drop
    log enable
    state {
      invalid enable
    }
  }
}

```

Here is an example of an IPv6 DMZ-WAN ruleset.

```

ipv6-name dmz-wan-6 {
  default-action drop
  default-log
  rule 1 {
    action accept
    state {
      established enable
      related enable
    }
  }
  rule 2 {
    action drop
    log enable
    state {
      invalid enable
    }
  }
  rule 100 {
    action accept
    log enable
    protocol ipv6-icmp
  }
  rule 200 {
    action accept
    destination {
      port 80,443
    }
    log enable
    protocol tcp
  }
  rule 300 {
    action accept
    destination {

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

    port 20,21
  }
  log enable
  protocol tcp
}
rule 500 {
  action accept
  destination {
    port 25
  }
  log enable
  protocol tcp
  source {
    address 2001:db8:0:BBBB::200
  }
}
rule 600 {
  action accept
  destination {
    port 53
  }
  log enable
  protocol tcp_udp
  source {
    address 2001:db8:0:BBBB::200
  }
}
rule 800 {
  action accept
  destination {
    port 22
  }
  log enable
  protocol tcp
}
}

```

Once you have all of your rulesets built, then you need to create your zone-policy.

Start by setting the interface and default action for each zone.

```

set firewall zone dmz default-action drop
set firewall zone dmz interface eth0.30

```

In this case, we are setting the v6 ruleset that represents traffic sourced from the LAN, destined for the DMZ. Because the zone-policy firewall syntax is a little awkward, I keep it straight by thinking of it backwards.

```

set firewall zone dmz from lan firewall ipv6-name lan-dmz-6

```

DMZ-LAN policy is LAN-DMZ. You can get a rhythm to it when you build out a bunch at one time.

In the end, you will end up with something like this config. I took out everything but the Firewall, Interfaces, and zone-policy sections. It is long enough as is.

### 12.1.3 IPv6 Tunnel

If you are using a IPv6 tunnel from HE.net or someone else, the basis is the same except you have two WAN interfaces. One for v4 and one for v6.

You would have 5 zones instead of just 4 and you would configure your v6 ruleset between your tunnel interface and your LAN/DMZ zones instead of to the WAN.

LAN, WAN, DMZ, local and TUN (tunnel)

v6 pairs would be:

```
lan-tun
lan-local
lan-dmz
tun-lan
tun-local
tun-dmz
local-lan
local-tun
local-dmz
dmz-lan
dmz-tun
dmz-local
```

Notice, none go to WAN since WAN wouldn't have a v6 address on it.

You would have to add a couple of rules on your wan-local ruleset to allow protocol 41 in.

Something like:

```
rule 400 {
    action accept
    destination {
        address 172.16.10.1
    }
    log enable
    protocol 41
    source {
        address ip.of.tunnel.broker
    }
}
```

## 12.2 BGP IPv6 unnumbered with extended nexthop

General information can be found in the *BGP* chapter.

## 12.2.1 Configuration

- Router A:

```
set protocols bgp system-as 64496
set protocols bgp address-family ipv4-unicast redistribute connected
set protocols bgp address-family ipv6-unicast redistribute connected
set protocols bgp neighbor eth1 interface v6only
set protocols bgp neighbor eth1 interface v6only peer-group 'fabric'
set protocols bgp neighbor eth2 interface v6only
set protocols bgp neighbor eth2 interface v6only peer-group 'fabric'
set protocols bgp parameters bestpath as-path multipath-relax
set protocols bgp parameters bestpath compare-routerid
set protocols bgp parameters default no-ipv4-unicast
set protocols bgp parameters router-id '192.168.0.1'
set protocols bgp peer-group fabric address-family ipv4-unicast
set protocols bgp peer-group fabric address-family ipv6-unicast
set protocols bgp peer-group fabric capability extended-nexthop
set protocols bgp peer-group fabric remote-as 'external'
```

- Router B:

```
set protocols bgp system-as 64499
set protocols bgp address-family ipv4-unicast redistribute connected
set protocols bgp address-family ipv6-unicast redistribute connected
set protocols bgp neighbor eth1 interface v6only
set protocols bgp neighbor eth1 interface v6only peer-group 'fabric'
set protocols bgp neighbor eth2 interface v6only
set protocols bgp neighbor eth2 interface v6only peer-group 'fabric'
set protocols bgp parameters bestpath as-path multipath-relax
set protocols bgp parameters bestpath compare-routerid
set protocols bgp parameters default no-ipv4-unicast
set protocols bgp parameters router-id '192.168.0.2'
set protocols bgp peer-group fabric address-family ipv4-unicast
set protocols bgp peer-group fabric address-family ipv6-unicast
set protocols bgp peer-group fabric capability extended-nexthop
set protocols bgp peer-group fabric remote-as 'external'
```

## 12.2.2 Results

- Router A:

```
vyos@vyos:~$ show interfaces

## 12.4 Route-Based Site-to-Site VPN to Azure (BGP over IKEv2/IPsec)

This guide shows an example of a route-based IKEv2 site-to-site VPN to Azure using VTI and BGP for dynamic routing updates.

For redundant / active-active configurations see *Route-Based Redundant Site-to-Site VPN to Azure (BGP over IKEv2/IPsec)*

### 12.4.1 Prerequisites

- A pair of Azure VNet Gateways deployed in active-passive configuration with BGP enabled.
- A local network gateway deployed in Azure representing the Vyos device, matching the below Vyos settings except for address space, which only requires the Vyos private IP, in this example 10.10.0.5/32
- A connection resource deployed in Azure linking the Azure VNet gateway and the local network gateway representing the Vyos device.

### 12.4.2 Example

WAN Interface	eth0
On-premises address space	10.10.0.0/16
Azure address space	10.0.0.0/16
Vyos public IP	198.51.100.3
Vyos private IP	10.10.0.5
Azure VNet Gateway public IP	203.0.113.2
Azure VNet Gateway BGP IP	10.0.0.4
Pre-shared key	ch00s3-4-s3cur3-psk
Vyos ASN	64499
Azure ASN	65540

### 12.4.3 Vyos configuration

- Configure the IKE and ESP settings to match a subset of those supported by Azure:

```
set vpn ipsec esp-group AZURE lifetime '3600'
set vpn ipsec esp-group AZURE mode 'tunnel'
set vpn ipsec esp-group AZURE pfs 'dh-group2'
set vpn ipsec esp-group AZURE proposal 1 encryption 'aes256'
set vpn ipsec esp-group AZURE proposal 1 hash 'sha1'

set vpn ipsec ike-group AZURE dead-peer-detection action 'restart'
set vpn ipsec ike-group AZURE dead-peer-detection interval '15'
set vpn ipsec ike-group AZURE dead-peer-detection timeout '30'
set vpn ipsec ike-group AZURE ikev2-reauth
set vpn ipsec ike-group AZURE key-exchange 'ikev2'
set vpn ipsec ike-group AZURE lifetime '28800'
set vpn ipsec ike-group AZURE proposal 1 dh-group '2'
set vpn ipsec ike-group AZURE proposal 1 encryption 'aes256'
set vpn ipsec ike-group AZURE proposal 1 hash 'sha1'
```

- Enable IPsec on eth0

```
set vpn ipsec interface 'eth0'
```

- Configure a VTI with a dummy IP address

```
set interfaces vti vti1 address '10.10.1.5/32'
set interfaces vti vti1 description 'Azure Tunnel'
```

- Clamp the VTI's MSS to 1350 to avoid PMTU blackholes.

```
set interfaces vti vti1 ip adjust-mss 1350
```

- Configure the VPN tunnel

```
set vpn ipsec authentication psk azure id '198.51.100.3'
set vpn ipsec authentication psk azure id '203.0.113.2'
set vpn ipsec authentication psk azure secret 'ch00s3-4-s3cur3-psk'
set vpn ipsec site-to-site peer azure authentication local-id '198.51.100.3'
set vpn ipsec site-to-site peer 203.0.113.2 authentication mode 'pre-shared-secret'
set vpn ipsec site-to-site peer 203.0.113.2 authentication remote-id '203.0.113.2'
set vpn ipsec site-to-site peer 203.0.113.2 connection-type 'respond'
set vpn ipsec site-to-site peer 203.0.113.2 description 'AZURE PRIMARY TUNNEL'
set vpn ipsec site-to-site peer 203.0.113.2 ike-group 'AZURE'
set vpn ipsec site-to-site peer 203.0.113.2 ikev2-reauth 'inherit'
set vpn ipsec site-to-site peer 203.0.113.2 local-address '10.10.0.5'
set vpn ipsec site-to-site peer azure remote-address '203.0.113.2'
set vpn ipsec site-to-site peer 203.0.113.2 vti bind 'vti1'
set vpn ipsec site-to-site peer 203.0.113.2 vti esp-group 'AZURE'
```

- **Important:** Add an interface route to reach Azure's BGP listener

```
set protocols static route 10.0.0.4/32 interface vti1
```

- Configure your BGP settings

```
set protocols bgp system-as 64499
set protocols bgp neighbor 10.0.0.4 remote-as '65540'
set protocols bgp neighbor 10.0.0.4 address-family ipv4-unicast soft-reconfiguration
  ↪ 'inbound'
set protocols bgp neighbor 10.0.0.4 timers holdtime '30'
set protocols bgp neighbor 10.0.0.4 timers keepalive '10'
```

- **Important:** Disable connected check

```
set protocols bgp neighbor 10.0.0.4 disable-connected-check
```

## 12.5 Route-Based Redundant Site-to-Site VPN to Azure (BGP over IKEv2/IPsec)

This guide shows an example of a redundant (active-active) route-based IKEv2 site-to-site VPN to Azure using VTI and BGP for dynamic routing updates.

### 12.5.1 Prerequisites

- A pair of Azure VNet Gateways deployed in active-active configuration with BGP enabled.
- A local network gateway deployed in Azure representing the Vyos device, matching the below Vyos settings except for address space, which only requires the Vyos private IP, in this example 10.10.0.5/32
- A connection resource deployed in Azure linking the Azure VNet gateway and the local network gateway representing the Vyos device.

### 12.5.2 Example

WAN Interface	eth0
On-premises address space	10.10.0.0/16
Azure address space	10.0.0.0/16
Vyos public IP	198.51.100.3
Vyos private IP	10.10.0.5
Azure VNet Gateway 1 public IP	203.0.113.2
Azure VNet Gateway 2 public IP	203.0.113.3
Azure VNet Gateway BGP IP	10.0.0.4,10.0.0.5
Pre-shared key	ch00s3-4-s3cur3-psk
Vyos ASN	64499
Azure ASN	65540

### 12.5.3 Vyos configuration

- Configure the IKE and ESP settings to match a subset of those supported by Azure:

```
set vpn ipsec esp-group AZURE lifetime '3600'
set vpn ipsec esp-group AZURE mode 'tunnel'
set vpn ipsec esp-group AZURE pfs 'dh-group2'
set vpn ipsec esp-group AZURE proposal 1 encryption 'aes256'
set vpn ipsec esp-group AZURE proposal 1 hash 'sha1'

set vpn ipsec ike-group AZURE dead-peer-detection action 'restart'
set vpn ipsec ike-group AZURE dead-peer-detection interval '15'
set vpn ipsec ike-group AZURE dead-peer-detection timeout '30'
set vpn ipsec ike-group AZURE ikev2-reauth
set vpn ipsec ike-group AZURE key-exchange 'ikev2'
set vpn ipsec ike-group AZURE lifetime '28800'
set vpn ipsec ike-group AZURE proposal 1 dh-group '2'
set vpn ipsec ike-group AZURE proposal 1 encryption 'aes256'
set vpn ipsec ike-group AZURE proposal 1 hash 'sha1'
```

- Enable IPsec on eth0

```
set vpn ipsec interface 'eth0'
```

- Configure two VTIs with a dummy IP address each

```
set interfaces vti vti1 address '10.10.1.5/32'
set interfaces vti vti1 description 'Azure Primary Tunnel'

set interfaces vti vti2 address '10.10.1.6/32'
set interfaces vti vti2 description 'Azure Secondary Tunnel'
```

- Clamp the VTI's MSS to 1350 to avoid PMTU blackholes.

```
set interfaces vti vti1 ip adjust-mss 1350
set interfaces vti vti2 ip adjust-mss 1350
```

- Configure the VPN tunnels

```
set vpn ipsec authentication psk azure id '198.51.100.3'
set vpn ipsec authentication psk azure id '203.0.113.2'
set vpn ipsec authentication psk azure id '203.0.113.3'
set vpn ipsec authentication psk azure secret 'ch00s3-4-s3cur3-psk'

set vpn ipsec site-to-site peer azure-primary authentication local-id '198.51.100.3'
set vpn ipsec site-to-site peer azure-primary authentication mode 'pre-shared-secret'
set vpn ipsec site-to-site peer azure-primary authentication remote-id '203.0.113.2'
set vpn ipsec site-to-site peer azure-primary connection-type 'respond'
set vpn ipsec site-to-site peer azure-primary description 'AZURE PRIMARY TUNNEL'
set vpn ipsec site-to-site peer azure-primary ike-group 'AZURE'
set vpn ipsec site-to-site peer azure-primary ikev2-reauth 'inherit'
set vpn ipsec site-to-site peer azure-primary local-address '10.10.0.5'
set vpn ipsec site-to-site peer azure-primary remote-address '203.0.113.2'
set vpn ipsec site-to-site peer azure-primary vti bind 'vti1'
set vpn ipsec site-to-site peer azure-primary vti esp-group 'AZURE'

set vpn ipsec site-to-site peer azure-secondary authentication local-id '198.51.100.3'
set vpn ipsec site-to-site peer azure-secondary authentication mode 'pre-shared-secret'
set vpn ipsec site-to-site peer azure-secondary authentication remote-id '203.0.113.3'
set vpn ipsec site-to-site peer azure-secondary connection-type 'respond'
set vpn ipsec site-to-site peer azure-secondary description 'AZURE secondary TUNNEL'
set vpn ipsec site-to-site peer azure-secondary ike-group 'AZURE'
set vpn ipsec site-to-site peer azure-secondary ikev2-reauth 'inherit'
set vpn ipsec site-to-site peer azure-secondary local-address '10.10.0.5'
set vpn ipsec site-to-site peer azure-secondary remote-address '203.0.113.3'
set vpn ipsec site-to-site peer azure-secondary vti bind 'vti2'
set vpn ipsec site-to-site peer azure-secondary vti esp-group 'AZURE'
```

- **Important:** Add an interface route to reach both Azure's BGP listeners

```
set protocols static route 10.0.0.4/32 interface vti1
set protocols static route 10.0.0.5/32 interface vti2
```

- Configure your BGP settings

```

set protocols bgp system-as 64499
set protocols bgp neighbor 10.0.0.4 remote-as '65540'
set protocols bgp neighbor 10.0.0.4 address-family ipv4-unicast soft-reconfiguration
↪ 'inbound'
set protocols bgp neighbor 10.0.0.4 timers holdtime '30'
set protocols bgp neighbor 10.0.0.4 timers keepalive '10'

set protocols bgp neighbor 10.0.0.5 remote-as '65540'
set protocols bgp neighbor 10.0.0.5 address-family ipv4-unicast soft-reconfiguration
↪ 'inbound'
set protocols bgp neighbor 10.0.0.5 timers holdtime '30'
set protocols bgp neighbor 10.0.0.5 timers keepalive '10'

```

- **Important:** Disable connected check, otherwise the routes learned from Azure will not be imported into the routing table.

```

set protocols bgp neighbor 10.0.0.4 disable-connected-check
set protocols bgp neighbor 10.0.0.5 disable-connected-check

```

## 12.6 High Availability Walkthrough

This document walks you through a complete HA setup of two VyOS machines. This design is based on a VM as the primary router and a physical machine as a backup, using VRRP, BGP, OSPF, and conntrack sharing.

This document aims to walk you through setting everything up, so at a point where you can reboot any machine and not lose more than a few seconds worth of connectivity.

### 12.6.1 Design

This is based on a real-life production design. One of the complex issues is ensuring you have redundant data INTO your network. We do this with a pair of Cisco Nexus switches and using Virtual PortChannels that are spanned across them. As a bonus, this also allows for complete switch failure without an outage. How you achieve this yourself is left as an exercise to the reader. But our setup is documented here.

#### Walkthrough suggestion

The `commit` command is implied after every section. If you make an error, `commit` will warn you and you can fix it before getting too far into things. Please ensure you commit early and commit often.

If you are following through this document, it is strongly suggested you complete the entire document, **ONLY** doing the virtual router1 steps, and then come back and walk through it **AGAIN** on the backup hardware router.

This ensures you don't go too fast or miss a step. However, it will make your life easier to configure the fixed IP address and default route now on the hardware router.

## Example Network

In this document, we have been allocated 203.0.113.0/24 by our upstream provider, which we are publishing on VLAN100.

They want us to establish a BGP session to their routers on 192.0.2.11 and 192.0.2.12 from our routers 192.0.2.21 and 192.0.2.22. They are AS 65550 and we are AS 65551.

Our routers are going to have a floating IP address of 203.0.113.1, and use .2 and .3 as their fixed IPs.

We are going to use 10.200.201.0/24 for an ,internal‘ network on VLAN201.

When traffic is originated from the 10.200.201.0/24 network, it will be masqueraded to 203.0.113.1

For connection between sites, we are running a WireGuard link to two REMOTE routers and using OSPF over those links to distribute routes. That remote site is expected to send traffic from anything in 10.201.0.0/16

## VLANs

These are the vlans we will be using:

- 50: Upstream, using the 192.0.2.0/24 network allocated by them.
- 100: ,Public‘ network, using our 203.0.113.0/24 network.
- 201: ,Internal‘ network, using 10.200.201.0/24

## Hardware

- switch1 (Nexus 10gb Switch)
- switch2 (Nexus 10gb Switch)
- compute1 (VMware ESXi 6.5)
- compute2 (VMware ESXi 6.5)
- compute3 (VMware ESXi 6.5)
- router2 (Random 1RU machine with 4 NICs)

Note that router1 is a VM that runs on one of the compute nodes.

## Network Cabling

- From Datacenter - This connects into port 1 on both switches, and is tagged as VLAN 50
- Cisco VPC Crossconnect - Ports 39 and 40 bonded between each switch
- Hardware Router - Port 8 of each switch
- compute1 - Port 9 of each switch
- compute2 - Port 10 of each switch
- compute3 - Port 11 of each switch

This is ignoring the extra Out-of-band management networking, which should be on totally different switches, and a different feed into the rack, and is out of scope of this.

---

**Bemerkung:** Our implementation uses VMware's Distributed Port Groups, which allows VMware to use LACP. This is a part of the ENTERPRISE licence, and is not available on a free licence. If you are implementing this and do not have access to DPGs, you should not use VMware, and use some other virtualization platform instead.

---

## 12.6.2 Basic Setup (via console)

Create your router1 VM. So it can withstand a VM Host failing or a network link failing. Using VMware, this is achieved by enabling vSphere DRS, vSphere Availability, and creating a Distributed Port Group that uses LACP.

Many other Hypervisors do this, and I'm hoping that this document will be expanded to document how to do this for others.

Create an 'All VLANs' network group, that passes all trunked traffic through to the VM. Attach this network group to router1 as eth0.

---

**Bemerkung:** VMware: You must DISABLE SECURITY on this Port group. Make sure that Promiscuous Mode, MAC address changes and Forged transmits are enabled. All of these will be done as part of failover.

---

### Bonding on Hardware Router

Create a LACP bond on the hardware router. We are assuming that eth0 and eth1 are connected to port 8 on both switches, and that those ports are configured as a Port-Channel.

```
set interfaces bonding bond0 description 'Switch Port-Channel'
set interfaces bonding bond0 hash-policy 'layer2'
set interfaces bonding bond0 member interface 'eth0'
set interfaces bonding bond0 member interface 'eth1'
set interfaces bonding bond0 mode '802.3ad'
```

### Assign external IP addresses

VLAN 100 and 201 will have floating IP addresses, but VLAN50 does not, as this is talking directly to upstream. Create our IP address on vlan50.

For the hardware router, replace eth0 with bond0. As (almost) every command is identical, this will not be specified unless different things need to be performed on different hosts.

```
set interfaces ethernet eth0 vif 50 address '192.0.2.21/24'
```

In this case, the hardware router has a different IP, so it would be

```
set interfaces ethernet bond0 vif 50 address '192.0.2.22/24'
```

### Add (temporary) default route

It is assumed that the routers provided by upstream are capable of acting as a default router, add that as a static route.

```
set protocols static route 0.0.0.0/0 next-hop 192.0.2.11
commit
save
```

### Enable SSH

Enable SSH so you can now SSH into the routers, rather than using the console.

```
set service ssh
commit
save
```

At this point, you should be able to SSH into both of them, and will no longer need access to the console (unless you break something!)

## 12.6.3 VRRP Configuration

We are setting up VRRP so that it does NOT fail back when a machine returns into service, and it prioritizes router1 over router2.

### Internal Network

This has a floating IP address of 10.200.201.1/24, using virtual router ID 201. The difference between them is the interface name, hello-source-address, and peer-address.

#### router1

```
set interfaces ethernet eth0 vif 201 address 10.200.201.2/24
set high-availability vrrp group int hello-source-address '10.200.201.2'
set high-availability vrrp group int interface 'eth0.201'
set high-availability vrrp group int peer-address '10.200.201.3'
set high-availability vrrp group int no-preempt
set high-availability vrrp group int priority '200'
set high-availability vrrp group int address '10.200.201.1/24'
set high-availability vrrp group int vrid '201'
```

#### router2

```
set interfaces ethernet bond0 vif 201 address 10.200.201.3/24
set high-availability vrrp group int hello-source-address '10.200.201.3'
set high-availability vrrp group int interface 'bond0.201'
set high-availability vrrp group int peer-address '10.200.201.2'
set high-availability vrrp group int no-preempt
set high-availability vrrp group int priority '100'
set high-availability vrrp group int address '10.200.201.1/24'
set high-availability vrrp group int vrid '201'
```

## Public Network

This has a floating IP address of 203.0.113.1/24, using virtual router ID 113. The virtual router ID is just a random number between 1 and 254, and can be set to whatever you want. Best practices suggest you try to keep them unique enterprise-wide.

### router1

```
set interfaces ethernet eth0 vif 100 address 203.0.113.2/24
set high-availability vrrp group public hello-source-address '203.0.113.2'
set high-availability vrrp group public interface 'eth0.100'
set high-availability vrrp group public peer-address '203.0.113.3'
set high-availability vrrp group public no-preempt
set high-availability vrrp group public priority '200'
set high-availability vrrp group public address '203.0.113.1/24'
set high-availability vrrp group public vrid '113'
```

### router2

```
set interfaces ethernet bond0 vif 100 address 203.0.113.3/24
set high-availability vrrp group public hello-source-address '203.0.113.3'
set high-availability vrrp group public interface 'bond0.100'
set high-availability vrrp group public peer-address '203.0.113.2'
set high-availability vrrp group public no-preempt
set high-availability vrrp group public priority '100'
set high-availability vrrp group public address '203.0.113.1/24'
set high-availability vrrp group public vrid '113'
```

## Create VRRP sync-group

The sync group is used to replicate connection tracking. It needs to be assigned to a random VRRP group, and we are creating a sync group called sync using the vrrp group int.

```
set high-availability vrrp sync-group sync member 'int'
```

## Testing

At this point, you should be able to see both IP addresses when you run `show interfaces`, and `show vrrp` should show both interfaces in MASTER state (and SLAVE state on router2).

```
vyos@router1:~$ show vrrp
Name      Interface    VRID  State    Last Transition
-----
int       eth0.201     201   MASTER   100s
public    eth0.100     113   MASTER   200s
vyos@router1:~$
```

You should be able to ping to and from all the IPs you have allocated.

## 12.6.4 NAT and conntrack-sync

Masquerade Traffic originating from 10.200.201.0/24 that is heading out the public interface.

**Bemerkung:** We explicitly exclude the primary upstream network so that BGP or OSPF traffic doesn't accidentally get NAT'ed.

```
set nat source rule 10 destination address '!192.0.2.0/24'
set nat source rule 10 outbound-interface name 'eth0.50'
set nat source rule 10 source address '10.200.201.0/24'
set nat source rule 10 translation address '203.0.113.1'
```

### Configure conntrack-sync and enable helpers

Conntrack helper modules are enabled by default, but they tend to cause more problems than they're worth in complex networks. You can disable all of them at one go.

```
delete system conntrack modules
```

Now enable replication between nodes. Replace eth0.201 with bond0.201 on the hardware router.

```
set service conntrack-sync accept-protocol 'tcp,udp,icmp'
set service conntrack-sync event-listen-queue-size '8'
set service conntrack-sync failover-mechanism vrrp sync-group 'sync'
set service conntrack-sync interface eth0.201
set service conntrack-sync mcast-group '224.0.0.50'
set service conntrack-sync sync-queue-size '8'
```

### Testing

The simplest way to test is to look at the connection tracking stats on the standby hardware router with the command `show conntrack-sync statistics`. The numbers should be very close to the numbers on the primary router.

When you have both routers up, you should be able to establish a connection from a NAT'ed machine out to the internet, reboot the active machine, and that connection should be preserved, and will not drop out.

## 12.6.5 OSPF Over WireGuard

Wireguard doesn't have the concept of an up or down link, due to its design. This complicates AND simplifies using it for network transport, as for reliable state detection you need to use SOMETHING to detect when the link is down.

If you use a routing protocol itself, you solve two problems at once. This is only a basic example, and is provided as a starting point.

## Configure Wireguard

There is plenty of instructions and documentation on setting up Wireguard. The only important thing you need to remember is to only use one WireGuard interface per OSPF connection.

We use small /30's from 10.254.60/24 for the point-to-point links.

### router1

Replace the 203.0.113.3 with whatever the other router's IP address is.

```
set interfaces wireguard wg01 address '10.254.60.1/30'
set interfaces wireguard wg01 description 'router1-to-offsite1'
set interfaces wireguard wg01 peer OFFSITE1 allowed-ips '0.0.0.0/0'
set interfaces wireguard wg01 peer OFFSITE1 endpoint '203.0.113.3:50001'
set interfaces wireguard wg01 peer OFFSITE1 persistent-keepalive '15'
set interfaces wireguard wg01 peer OFFSITE1 pubkey 'GEFMOWzAyau42/
↪HwdwfXnrfHdIISQF8YHj35r0gSZ0o='
set interfaces wireguard wg01 port '50001'
set protocols ospf interface wg01 authentication md5 key-id 1 md5-key 'i360KoCwUGZvPq7e'
set protocols ospf interface wg01 cost '11'
set protocols ospf interface wg01 dead-interval '5'
set protocols ospf interface wg01 hello-interval '1'
set protocols ospf interface wg01 network 'point-to-point'
set protocols ospf interface wg01 priority '1'
set protocols ospf interface wg01 retransmit-interval '5'
set protocols ospf interface wg01 transmit-delay '1'
```

### offsite1

This is connecting back to the STATIC IP of router1, not the floating.

```
set interfaces wireguard wg01 address '10.254.60.2/30'
set interfaces wireguard wg01 description 'offsite1-to-router1'
set interfaces wireguard wg01 peer ROUTER1 allowed-ips '0.0.0.0/0'
set interfaces wireguard wg01 peer ROUTER1 endpoint '192.0.2.21:50001'
set interfaces wireguard wg01 peer ROUTER1 persistent-keepalive '15'
set interfaces wireguard wg01 peer ROUTER1 pubkey 'CKwMV3ZaLntMule2Kd3G7UyVBR7zE8/
↪qoZgLb82EE2Q='
set interfaces wireguard wg01 port '50001'
set protocols ospf interface wg01 authentication md5 key-id 1 md5-key 'i360KoCwUGZvPq7e'
set protocols ospf interface wg01 cost '11'
set protocols ospf interface wg01 dead-interval '5'
set protocols ospf interface wg01 hello-interval '1'
set protocols ospf interface wg01 network 'point-to-point'
set protocols ospf interface wg01 priority '1'
set protocols ospf interface wg01 retransmit-interval '5'
set protocols ospf interface wg01 transmit-delay '1'
```

## Test WireGuard

Make sure you can ping 10.254.60.1 and .2 from both routers.

## Create Export Filter

We only want to export the networks we know. Always do a whitelist on your route filters, both importing and exporting. A good rule of thumb is **,If you are not the default router for a network, don't advertise it'**. This means we explicitly do not want to advertise the 192.0.2.0/24 network (but do want to advertise 10.200.201.0 and 203.0.113.0, which we ARE the default route for). This filter is applied to **redistribute connected**. If we WERE to advertise it, the remote machines would see 192.0.2.21 available via their default route, establish the connection, and then OSPF would say ,192.0.2.0/24 is available via this tunnel', at which point the tunnel would break, OSPF would drop the routes, and then 192.0.2.0/24 would be reachable via default again. This is called ,flapping'.

```
set policy access-list 150 description 'Outbound OSPF Redistribution'
set policy access-list 150 rule 10 action 'permit'
set policy access-list 150 rule 10 destination any
set policy access-list 150 rule 10 source inverse-mask '0.0.0.255'
set policy access-list 150 rule 10 source network '10.200.201.0'
set policy access-list 150 rule 20 action 'permit'
set policy access-list 150 rule 20 destination any
set policy access-list 150 rule 20 source inverse-mask '0.0.0.255'
set policy access-list 150 rule 20 source network '203.0.113.0'
set policy access-list 150 rule 100 action 'deny'
set policy access-list 150 rule 100 destination any
set policy access-list 150 rule 100 source any
```

## Create Import Filter

We only want to import networks we know. Our OSPF peer should only be advertising networks in the 10.201.0.0/16 range. Note that this is an INVERSE MATCH. You deny in access-list 100 to accept the route.

```
set policy access-list 100 description 'Inbound OSPF Routes from Peers'
set policy access-list 100 rule 10 action 'deny'
set policy access-list 100 rule 10 destination any
set policy access-list 100 rule 10 source inverse-mask '0.0.255.255'
set policy access-list 100 rule 10 source network '10.201.0.0'
set policy access-list 100 rule 100 action 'permit'
set policy access-list 100 rule 100 destination any
set policy access-list 100 rule 100 source any
set policy route-map PUBOSPF rule 100 action 'deny'
set policy route-map PUBOSPF rule 100 match ip address access-list '100'
set policy route-map PUBOSPF rule 500 action 'permit'
```

## Enable OSPF

Every router **must** have a unique router-id. The ,reference-bandwidth' is used because when OSPF was originally designed, the idea of a link faster than 1gbit was unheard of, and it does not scale correctly.

```
set protocols ospf area 0.0.0.0 authentication 'md5'
set protocols ospf area 0.0.0.0 network '10.254.60.0/24'
set protocols ospf auto-cost reference-bandwidth '10000'
set protocols ospf log-adjacency-changes
set protocols ospf parameters abr-type 'cisco'
set protocols ospf parameters router-id '10.254.60.2'
set protocols ospf route-map PUBOSPF
```

## Test OSPF

When you have enabled OSPF on both routers, you should be able to see each other with the command `show ip ospf neighbour`. The state must be ,Full' or ,2-Way'. If it is not, then there is a network connectivity issue between the hosts. This is often caused by NAT or MTU issues. You should not see any new routes (unless this is the second pass) in the output of `show ip route`

### 12.6.6 Advertise connected routes

As a reminder, only advertise routes that you are the default router for. This is why we are NOT announcing the 192.0.2.0/24 network, because if that was announced into OSPF, the other routers would try to connect to that network over a tunnel that connects to that network!

```
set protocols ospf access-list 150 export 'connected'
set protocols ospf redistribute connected
```

You should now be able to see the advertised network on the other host.

## Duplicate configuration

At this point, you now need to create the X link between all four routers. Use a different /30 for each link.

## Priorities

Set the cost on the secondary links to be 200. This means that they will not be used unless the primary links are down.

```
set protocols ospf interface wg01 cost '10'
set protocols ospf interface wg01 cost '200'
```

This will be visible in ,show ip route'.

## 12.6.7 BGP

BGP is an extremely complex network protocol. An example is provided here.

---

**Bemerkung:** Router id's must be unique.

---

### router1

The `redistribute ospf` command is there purely as an example of how this can be expanded. In this walkthrough, it will be filtered by BGPOUT rule 10000, as it is not 203.0.113.0/24.

```
set policy prefix-list BGPOUT description 'BGP Export List'
set policy prefix-list BGPOUT rule 10 action 'deny'
set policy prefix-list BGPOUT rule 10 description 'Do not advertise short masks'
set policy prefix-list BGPOUT rule 10 ge '25'
set policy prefix-list BGPOUT rule 10 prefix '0.0.0.0/0'
set policy prefix-list BGPOUT rule 100 action 'permit'
set policy prefix-list BGPOUT rule 100 description 'Our network'
set policy prefix-list BGPOUT rule 100 prefix '203.0.113.0/24'
set policy prefix-list BGPOUT rule 10000 action 'deny'
set policy prefix-list BGPOUT rule 10000 prefix '0.0.0.0/0'

set policy route-map BGPOUT description 'BGP Export Filter'
set policy route-map BGPOUT rule 10 action 'permit'
set policy route-map BGPOUT rule 10 match ip address prefix-list 'BGPOUT'
set policy route-map BGPOUT rule 10000 action 'deny'
set policy route-map BGPPREPENDOUT description 'BGP Export Filter'
set policy route-map BGPPREPENDOUT rule 10 action 'permit'
set policy route-map BGPPREPENDOUT rule 10 set as-path prepend '65551 65551 65551'
set policy route-map BGPPREPENDOUT rule 10 match ip address prefix-list 'BGPOUT'
set policy route-map BGPPREPENDOUT rule 10000 action 'deny'

set protocols bgp system-as 65551
set protocols bgp address-family ipv4-unicast network 192.0.2.0/24
set protocols bgp address-family ipv4-unicast redistribute connected metric '50'
set protocols bgp address-family ipv4-unicast redistribute ospf metric '50'
set protocols bgp neighbor 192.0.2.11 address-family ipv4-unicast route-map export
↪ 'BGPOUT'
set protocols bgp neighbor 192.0.2.11 address-family ipv4-unicast soft-reconfiguration_
↪ inbound
set protocols bgp neighbor 192.0.2.11 remote-as '65550'
set protocols bgp neighbor 192.0.2.11 update-source '192.0.2.21'
set protocols bgp parameters router-id '192.0.2.21'
```

### router2

This is identical, but you use the BGPPREPENDOUT route-map to advertise the route with a longer path.

## 12.7 WAN Load Balancer examples

### 12.7.1 Example 1: Distributing load evenly

The setup used in this example is shown in the following diagram:

## Overview

- All traffic coming in through eth2 is balanced between eth0 and eth1 on the router.
- Pings will be sent to four targets for health testing (33.44.55.66, 44.55.66.77, 55.66.77.88 and 66.77.88.99).
- All outgoing packets are assigned the source address of the assigned interface (SNAT).
- eth0 is set to be removed from the load balancer's interface pool after 5 ping failures, eth1 will be removed after 4 ping failures.

## Create static routes to ping targets

Create static routes through the two ISPs towards the ping targets and commit the changes:

```
set protocols static route 33.44.55.66/32 next-hop 11.22.33.1
set protocols static route 44.55.66.77/32 next-hop 11.22.33.1
set protocols static route 55.66.77.88/32 next-hop 22.33.44.1
set protocols static route 66.77.88.99/32 next-hop 22.33.44.1
```

## Configure the load balancer

Configure the WAN load balancer with the parameters described above:

```
set load-balancing wan interface-health eth0 failure-count 5
set load-balancing wan interface-health eth0 nexthop 11.22.33.1
set load-balancing wan interface-health eth0 test 10 type ping
set load-balancing wan interface-health eth0 test 10 target 33.44.55.66
set load-balancing wan interface-health eth0 test 20 type ping
set load-balancing wan interface-health eth0 test 20 target 44.55.66.77
set load-balancing wan interface-health eth1 failure-count 4
set load-balancing wan interface-health eth1 nexthop 22.33.44.1
set load-balancing wan interface-health eth1 test 10 type ping
set load-balancing wan interface-health eth1 test 10 target 55.66.77.88
set load-balancing wan interface-health eth1 test 20 type ping
set load-balancing wan interface-health eth1 test 20 target 66.77.88.99
set load-balancing wan rule 10 inbound-interface eth2
set load-balancing wan rule 10 interface eth0
set load-balancing wan rule 10 interface eth1
```

### 12.7.2 Example 2: Failover based on interface weights

This example uses the failover mode.

## Overview

In this example, eth0 is the primary interface and eth1 is the secondary interface. To provide simple failover functionality. If eth0 fails, eth1 takes over.

### Create interface weight based configuration

The configuration steps are the same as in the previous example, except rule 10. So we keep the configuration, remove rule 10 and add a new rule for the failover mode:

```
delete load-balancing wan rule 10
set load-balancing wan rule 10 failover
set load-balancing wan rule 10 inbound-interface eth2
set load-balancing wan rule 10 interface eth0 weight 10
set load-balancing wan rule 10 interface eth1 weight 1
```

## 12.7.3 Example 3: Failover based on rule order

The previous example used the failover command to send traffic through eth1 if eth0 fails. In this example, failover functionality is provided by rule order.

## Overview

Two rules will be created, the first rule directs traffic coming in from eth2 to eth0 and the second rule directs the traffic to eth1. If eth0 fails the first rule is bypassed and the second rule matches, directing traffic to eth1.

### Create rule order based configuration

We keep the configuration from the previous example, delete rule 10 and create the two new rules as described:

```
delete load-balancing wan rule 10
set load-balancing wan rule 10 inbound-interface eth2
set load-balancing wan rule 10 interface eth0
set load-balancing wan rule 20 inbound-interface eth2
set load-balancing wan rule 20 interface eth1
```

## 12.7.4 Example 4: Failover based on rule order - priority traffic

A rule order for prioritizing traffic is useful in scenarios where the secondary link has a lower speed and should only carry high priority traffic. It is assumed for this example that eth1 is connected to a slower connection than eth0 and should prioritize VoIP traffic.

## Overview

A rule order for prioritizing traffic is useful in scenarios where the secondary link has a lower speed and should only carry high priority traffic. It is assumed for this example that eth1 is connected to a slower connection than eth0 and should prioritize VoIP traffic.

### Create rule order based configuration with low speed secondary link

We keep the configuration from the previous example, delete rule 20 and create a new rule as described:

```
delete load-balancing wan rule 20
set load-balancing wan rule 20 inbound-interface eth2
set load-balancing wan rule 20 interface eth1
set load-balancing wan rule 20 destination port sip
set load-balancing wan rule 20 protocol tcp
set protocols static route 0.0.0.0/0 next-hop 11.22.33.1
```

## 12.7.5 Example 5: Exclude traffic from load balancing

In this example two LAN interfaces exist in different subnets instead of one like in the previous examples:

### Adding a rule for the second interface

Based on the previous example, another rule for traffic from the second interface eth3 can be added to the load balancer. However, traffic meant to flow between the LAN subnets will be sent to eth0 and eth1 as well. To prevent this, another rule is required. This rule excludes traffic between the local subnets from the load balancer. It also excludes locally-sources packets (required for web caching with load balancing). eth+ is used as an alias that refers to all ethernet interfaces:

```
set load-balancing wan rule 5 exclude
set load-balancing wan rule 5 inbound-interface eth+
set load-balancing wan rule 5 destination address 10.0.0.0/8
```

## 12.8 PPPoE IPv6 Basic Setup for Home Network

This document is to describe a basic setup using PPPoE with DHCPv6-PD + SLAAC to construct a typical home network. The user can follow the steps described here to quickly setup a working network and use this as a starting point to further configure or fine-tune other settings.

To achieve this, your ISP is required to support DHCPv6-PD. If you're not sure, please contact your ISP for more information.

### 12.8.1 Network Topology

### 12.8.2 Configurations

#### PPPoE Setup

```

set interfaces pppoe pppoe0 authentication password <YOUR PASSWORD>
set interfaces pppoe pppoe0 authentication user <YOUR USERNAME>
set interfaces pppoe pppoe0 service-name <YOUR SERVICENAME>
set interfaces pppoe pppoe0 source-interface 'eth0'
  
```

- Fill password and user with the credential provided by your ISP.
- service-name can be an arbitrary string.

#### DHCPv6-PD Setup

During address configuration, in addition to assigning an address to the WAN interface, ISP also provides a prefix to allow the router to configure addresses of LAN interface and other nodes connecting to LAN, which is called prefix delegation (PD).

```

set interfaces pppoe pppoe0 ipv6 address autoconf
set interfaces pppoe pppoe0 dhcpv6-options pd 0 interface eth1 address '100'
  
```

- Here we use the prefix to configure the address of eth1 (LAN) to form <prefix>::64, where 64 is hexadecimal of address 100.
- For home network users, most of time ISP only provides /64 prefix, hence there is no need to set SLA ID and prefix length. See [PPPoE](#) for more information.

## Router Advertisement

We need to enable router advertisement for LAN network so that PC can receive the prefix and use SLAAC to configure the address automatically.

```
set service router-advert interface eth1 link-mtu '1492'
set service router-advert interface eth1 name-server <NAME SERVER>
set service router-advert interface eth1 prefix '::/64 valid-lifetime '172800'
```

- Set MTU in advertisement to 1492 because of PPPoE header overhead.
- Set DNS server address in the advertisement so that clients can obtain it by using RDNSS option. Most operating systems (Windows, Linux, Mac) should already support it.
- Here we set the prefix to ::/64 to indicate advertising any /64 prefix the LAN interface is assigned.
- Since some ISPs disconnects continuous connection for every 2~3 days, we set valid-lifetime to 2 days to allow PC for phasing out old address.

## Basic Firewall

To have basic protection while keeping IPv6 network functional, we need to:

- Allow all established and related traffic for router and LAN
- Allow all icmpv6 packets for router and LAN
- Allow DHCPv6 packets for router

```
set firewall ipv6 name WAN_IN default-action 'drop'
set firewall ipv6 name WAN_IN rule 10 action 'accept'
set firewall ipv6 name WAN_IN rule 10 state established 'enable'
set firewall ipv6 name WAN_IN rule 10 state related 'enable'
set firewall ipv6 name WAN_IN rule 20 action 'accept'
set firewall ipv6 name WAN_IN rule 20 protocol 'icmpv6'
set firewall ipv6 name WAN_LOCAL default-action 'drop'
set firewall ipv6 name WAN_LOCAL rule 10 action 'accept'
set firewall ipv6 name WAN_LOCAL rule 10 state established 'enable'
set firewall ipv6 name WAN_LOCAL rule 10 state related 'enable'
set firewall ipv6 name WAN_LOCAL rule 20 action 'accept'
set firewall ipv6 name WAN_LOCAL rule 20 protocol 'icmpv6'
set firewall ipv6 name WAN_LOCAL rule 30 action 'accept'
set firewall ipv6 name WAN_LOCAL rule 30 destination port '546'
set firewall ipv6 name WAN_LOCAL rule 30 protocol 'udp'
set firewall ipv6 name WAN_LOCAL rule 30 source port '547'
set firewall ipv6 forward filter rule 10 action jump
set firewall ipv6 forward filter rule 10 jump-target 'WAN_IN'
set firewall ipv6 forward filter rule 10 inbound-interface name 'pppoe0'
set firewall ipv6 input filter rule 10 action jump
set firewall ipv6 input filter rule 10 jump-target 'WAN_LOCAL'
set firewall ipv6 input filter rule 10 inbound-interface name 'pppoe0'
```

Note to allow the router to receive DHCPv6 response from ISP. We need to allow packets with source port 547 (server) and destination port 546 (client).

## 12.9 L3VPN for Hub-and-Spoke connectivity with VyOS

IP/MPLS technology is widely used by various service providers and large enterprises in order to achieve better network scalability, manageability and flexibility. It also provides the possibility to deliver different services for the customers in a seamless manner. Layer 3 VPN (L3VPN) is a type of VPN mode that is built and delivered through OSI layer 3 networking technologies. Often the border gateway protocol (BGP) is used to send and receive VPN-related data that is responsible for the control plane. L3VPN utilizes virtual routing and forwarding (VRF) techniques to receive and deliver user data as well as separate data planes of the end-users. It is built using a combination of IP- and MPLS-based information. Generally, L3VPNs are used to send data on back-end VPN infrastructures, such as for VPN connections between data centres, HQs and branches.

An L3VPN consists of multiple access links, multiple VPN routing and forwarding (VRF) tables, and multiple MPLS paths or multiple P2MP LSPs. An L3VPN can be configured to connect two or more customer sites. In hub-and-spoke MPLS L3VPN environments, the spoke routers need to have unique Route Distinguishers (RDs). In order to use the hub site as a transit point for connectivity in such an environment, the spoke sites export their routes to the hub. Spokes can talk to hubs, but never have direct paths to other spokes. All traffic between spokes is controlled and delivered over the hub site.

To deploy a Layer3 VPN with MPLS on VyOS, we should meet a couple requirements in order to properly implement the solution. We'll use the following nodes in our LAB environment:

- 2 x Route reflectors (VyOS-RRx)
- 4 x Provider routers (VyOS-Px)
- 3 x Provider Edge (VyOS-PEx)
- 3 x Customer Edge (VyOS-CEx)

The following software was used in the creation of this document:

- Operating system: VyOS
- Version: 1.4-rolling-202110310317
- Image name: vyos-1.4-rolling-202110310317-amd64.iso

**NOTE:** VyOS Router (tested with VyOS 1.4-rolling-202110310317) – The configurations below are specifically for VyOS 1.4.x.

General information can be found in the [L3VPN VRFs](#) chapter.

## 12.9.1 Topology

## 12.9.2 How does it work?

As we know the main assumption of L3VPN “Hub and Spoke” is, that the traffic between spokes have to pass via hub, in our scenario VyOS-PE2 is the Hub PE and the VyOS-CE1-HUB is the central customer office device that is responsible for controlling access between all spokes and announcing its network prefixes (10.0.0.100/32). VyOS-PE2 has the main VRF (its name is BLUE\_HUB), its own Route-Distinguisher(RD) and route-target import/export lists. Multiprotocol-BGP(MP-BGP) delivers L3VPN related control-plane information to the nodes across network where PEs Spokes import the route-target 60535:1030 (this is export route-target of vrf BLUE\_HUB) and export its own route-target 60535:1011(this is vrf BLUE\_SPOKE export route-target). Therefore, the Customer edge nodes can only learn the network prefixes of the HUB site [10.0.0.100/32]. For this example VyOS-CE1 has network prefixes [10.0.0.80/32] / VyOS-CE2 has network prefixes [10.0.0.90/32]. Route-Reflector devices VyOS-RR1 and VyOS-RR2 are used to simplify network routes exchange and minimize iBGP peerings between devices.

L3VPN configuration parameters table:

Node	Role	VRF	RD	RT import	RT export
VyOS-PE2	Hub	BLUE_HUB	10.80.80.1:1011	65035:1011 65035:1030	65035:1030
VyOS-PE1	Spoke	BLUE_SPOKE	10.50.50.1:1011	65035:1030	65035:1011
VyOS-PE3	Spoke	BLUE_SPOKE	10.60.60.1:1011	65035:1030	65035:1011

## 12.9.3 Configuration

### Step-1: Configuring IGP and enabling MPLS LDP

At the first step we need to configure the IP/MPLS backbone network using OSPF as IGP protocol and LDP as label-switching protocol for the base connectivity between **P** (rovider), **P** (rovider) **E** (dge) and **R** (oute) **R** (efflector) nodes:

set protocols ospf area 0 network '0.0.0.0/0'
set protocols ospf parameters abr-type 'cisco'
set protocols ospf parameters router-id '10.0.0.2'
```

## Step-2: Configuring iBGP for L3VPN control-plane

At this step we are going to enable iBGP protocol on MPLS nodes and Route Reflectors (two routers for redundancy) that will deliver IPv4 VPN (L3VPN) routes between them:

- VyOS-RR1:

```
set protocols bgp system-as '65001'
set protocols bgp neighbor 10.0.0.7 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.7 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.8 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.8 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.10 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.10 peer-group 'RR_VPNv4'
set protocols bgp parameters cluster-id '10.0.0.1'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.0.0.1'
set protocols bgp peer-group RR_VPNv4 remote-as '65001'
set protocols bgp peer-group RR_VPNv4 update-source 'dum10'
```

- VyOS-RR2:

```
set protocols bgp system-as '65001'
set protocols bgp neighbor 10.0.0.7 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.7 peer-group 'RR_VPNv4'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set protocols bgp neighbor 10.0.0.8 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.8 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.10 address-family ipv4-vpn route-reflector-client
set protocols bgp neighbor 10.0.0.10 peer-group 'RR_VPNv4'
set protocols bgp parameters cluster-id '10.0.0.1'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.0.0.2'
set protocols bgp peer-group RR_VPNv4 remote-as '65001'
set protocols bgp peer-group RR_VPNv4 update-source 'dum10'

```

- VyOS-PE1:

```

set protocols bgp system-as '65001'
set protocols bgp neighbor 10.0.0.1 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.1 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.2 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.2 peer-group 'RR_VPNv4'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.0.0.7'
set protocols bgp peer-group RR_VPNv4 remote-as '65001'
set protocols bgp peer-group RR_VPNv4 update-source 'dum10'

```

- VyOS-PE2:

```

set protocols bgp system-as '65001'
set protocols bgp neighbor 10.0.0.1 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.1 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.2 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.2 peer-group 'RR_VPNv4'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.0.0.8'
set protocols bgp peer-group RR_VPNv4 remote-as '65001'
set protocols bgp peer-group RR_VPNv4 update-source 'dum10'

```

- VyOS-PE3:

```

set protocols bgp system-as '65001'
set protocols bgp neighbor 10.0.0.1 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.1 peer-group 'RR_VPNv4'
set protocols bgp neighbor 10.0.0.2 address-family ipv4-vpn nexthop-self
set protocols bgp neighbor 10.0.0.2 peer-group 'RR_VPNv4'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.0.0.10'
set protocols bgp peer-group RR_VPNv4 remote-as '65001'
set protocols bgp peer-group RR_VPNv4 update-source 'dum10'

```

### Step-3: Configuring L3VPN VRFs on PE nodes

This section provides configuration steps for setting up VRFs on our PE nodes including CE facing interfaces, BGP, rd and route-target import/export based on the pre-defined parameters.

- VyOS-PE1:

```
# VRF settings
set vrf name BLUE_SPOKE table '200'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast export vpn
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast import vpn
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast label vpn export 'auto'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast network 10.50.50.0/24
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast rd vpn export '10.50.
↪50.1:1011'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast redistribute connected
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast route-target vpn↪
↪export '65035:1011'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast route-target vpn↪
↪import '65035:1030'
set vrf name BLUE_SPOKE protocols bgp system-as '65001'
set vrf name BLUE_SPOKE protocols bgp neighbor 10.50.50.2 address-family ipv4-unicast as-
↪override
set vrf name BLUE_SPOKE protocols bgp neighbor 10.50.50.2 remote-as '65035'

# interfaces
set interfaces ethernet eth3 address '10.50.50.1/24'
set interfaces ethernet eth3 vrf 'BLUE_SPOKE'
```

- VyOS-PE2:

```
# VRF settings
set vrf name BLUE_HUB table '400'
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast export vpn
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast import vpn
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast label vpn export 'auto'
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast network 10.80.80.0/24
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast rd vpn export '10.80.80.
↪1:1011'
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast redistribute connected
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast route-target vpn export
↪'65035:1030'
set vrf name BLUE_HUB protocols bgp address-family ipv4-unicast route-target vpn import
↪'65035:1011 65050:2011 65035:1030'
set vrf name BLUE_HUB protocols bgp system-as '65001'
set vrf name BLUE_HUB protocols bgp neighbor 10.80.80.2 address-family ipv4-unicast as-
↪override
set vrf name BLUE_HUB protocols bgp neighbor 10.80.80.2 remote-as '65035'

# interfaces
set interfaces ethernet eth3 address '10.80.80.1/24'
set interfaces ethernet eth3 vrf 'BLUE_HUB'
```

- VyOS-PE3:

```
# VRF settings
set vrf name BLUE_SPOKE table '200'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast export vpn
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast import vpn
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast label vpn export 'auto'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast network 10.60.60.0/24
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast rd vpn export '10.60.
↳60.1:1011'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast redistribute connected
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast route-target vpn↳
↳export '65035:1011'
set vrf name BLUE_SPOKE protocols bgp address-family ipv4-unicast route-target vpn↳
↳import '65035:1030'
set vrf name BLUE_SPOKE protocols bgp system-as '65001'
set vrf name BLUE_SPOKE protocols bgp neighbor 10.60.60.2 address-family ipv4-unicast as-
↳override
set vrf name BLUE_SPOKE protocols bgp neighbor 10.60.60.2 remote-as '65035'

# interfaces
set interfaces ethernet eth3 address '10.60.60.1/24'
set interfaces ethernet eth3 vrf 'BLUE_SPOKE'
```

#### Step-4: Configuring CE nodes

Dynamic routing used between CE and PE nodes and eBGP peering established for the route exchanging between them. All routes received by PE are then exported to L3VPN and delivered from Spoke sites to Hub and vice-versa based on previously configured L3VPN parameters.

- VyOS-CE1-SPOKE:

```
# interfaces
set interfaces dummy dum20 address '10.0.0.80/32'
set interfaces ethernet eth0 address '10.50.50.2/24'

# BGP for peering with PE
set protocols bgp system-as 65035
set protocols bgp address-family ipv4-unicast network 10.0.0.80/32
set protocols bgp neighbor 10.50.50.1 ebgp-multihop '2'
set protocols bgp neighbor 10.50.50.1 remote-as '65001'
set protocols bgp neighbor 10.50.50.1 update-source 'eth0'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.50.50.2'
```

- VyOS-CE1-HUB:

```
# interfaces
set interfaces dummy dum20 address '10.0.0.100/32'
set interfaces ethernet eth0 address '10.80.80.2/24'

# BGP for peering with PE
set protocols bgp system-as 65035
set protocols bgp address-family ipv4-unicast network 10.0.0.100/32
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
set protocols bgp address-family ipv4-unicast redistribute connected
set protocols bgp neighbor 10.80.80.1 ebgp-multihop '2'
set protocols bgp neighbor 10.80.80.1 remote-as '65001'
set protocols bgp neighbor 10.80.80.1 update-source 'eth0'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.80.80.2'
```

- VyOS-CE2-SPOKE:

```
# interfaces
set interfaces dummy dum20 address '10.0.0.90/32'
set interfaces ethernet eth0 address '10.60.60.2/24'

# BGP for peering with PE
set protocols bgp system-as 65035
set protocols bgp address-family ipv4-unicast network 10.0.0.90/32
set protocols bgp neighbor 10.60.60.1 ebgp-multihop '2'
set protocols bgp neighbor 10.60.60.1 remote-as '65001'
set protocols bgp neighbor 10.60.60.1 update-source 'eth0'
set protocols bgp parameters log-neighbor-changes
set protocols bgp parameters router-id '10.60.60.2'
```

## Step-5: Verification

This section describes verification commands for MPLS/BGP/LDP protocols and L3VPN related routes as well as diagnosis and reachability checks between CE nodes.

Let's check IPv4 routing and MPLS information on provider nodes (same procedure for all P nodes):

- “show ip ospf neighbor” for checking ospf relationship

```
vyos@VyOS-P1:~$ show ip ospf neighbor
```

Neighbor ID	Pri	State	Dead Time	Address	Interface	RXmtL
10.0.0.4	1	Full/Backup	34.718s	172.16.30.2	eth0:172.16.30.1	
0	0	0				
10.0.0.5	1	Full/Backup	35.132s	172.16.40.2	eth1:172.16.40.1	
0	0	0				
10.0.0.7	1	Full/Backup	34.764s	172.16.90.2	eth2:172.16.90.1	
0	0	0				
10.0.0.1	1	Full/Backup	35.642s	172.16.10.2	eth3:172.16.10.1	
0	0	0				
10.0.0.8	1	Full/Backup	35.484s	172.16.100.2	eth5:172.16.100.1	
0	0	0				

- „show mpls ldp neighbor „ zur Überprüfung von ldp-Nachbarn

```
vyos@VyOS-P1:~$ show mpls ldp neighbor
```

AF	ID	State	Remote Address	Uptime
ipv4	10.0.0.1	OPERATIONAL	10.0.0.1	07w5d06h
ipv4	10.0.0.4	OPERATIONAL	10.0.0.4	09w3d00h

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

ipv4 10.0.0.5	OPERATIONAL	10.0.0.5	09w2d23h
ipv4 10.0.0.7	OPERATIONAL	10.0.0.7	03w0d01h
ipv4 10.0.0.8	OPERATIONAL	10.0.0.8	01w3d02h

- „show mpls ldp binding“ zur Überprüfung der mpls-Label-Zuweisung

```
vyos@VyOS-P1:~$ show mpls ldp discovery
```

AF	Destination	Nexthop	Local	Label Remote	Label	In Use
ipv4	10.0.0.1/32	10.0.0.1	23		imp-null	yes

ipv4	10.0.0.8/32	10.0.0.7	24		22	no
ipv4	10.0.0.8/32	10.0.0.8	24		imp-null	yes
ipv4	10.0.0.9/32	10.0.0.1	18		23	no
ipv4	10.0.0.9/32	10.0.0.4	18		21	yes
ipv4	10.0.0.9/32	10.0.0.5	18		22	no
ipv4	10.0.0.9/32	10.0.0.7	18		23	no

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

ipv4 10.0.0.9/32	10.0.0.8	18	23	no
ipv4 10.0.0.10/32	10.0.0.1	19	24	no
ipv4 10.0.0.10/32	10.0.0.4	19	24	yes
ipv4 10.0.0.10/32	10.0.0.5	19	23	yes
ipv4 10.0.0.10/32	10.0.0.7	19	24	no
ipv4 10.0.0.10/32	10.0.0.8	19	24	no

Now we're checking iBGP status and routes from route-reflector nodes to other devices:

- “show bgp ipv4 vpn summary” for checking BGP VPNv4 neighbors:

```
vyos@VyOS-RR1:~$ show bgp ipv4 vpn summary
BGP router identifier 10.0.0.1, local AS number 65001 vrf-id 0
BGP table version 0
RIB entries 9, using 1728 bytes of memory
Peers 4, using 85 KiB of memory
Peer groups 1, using 64 bytes of memory
```

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
↪ PfxSnt									
10.0.0.7		4	65001	7719	7733			0	0 0 0
↪ 5d07h56m		2	10						
10.0.0.8		4	65001	7715	7724			0	0 0 0
↪ 5d08h28m		4	10						
10.0.0.9		4	65001	7713	7724			0	0 0 0
↪ 5d08h28m		2	10						
10.0.0.10	4	65001	7713	7724			0	0	0 5d08h28m
↪ 2	10								

```
Total number of neighbors 4
```

- “show bgp ipv4 vpn” for checking all VPNv4 prefixes information:

```
vyos@VyOS-RR1:~$ show bgp ipv4 vpn
BGP table version is 2, local router ID is 10.0.0.1, vrf id 0
Default local pref 100, local AS 65001
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
               i internal, r RIB-failure, S Stale, R Removed
Nexthop codes: @NNN nexthop's vrf id, < announce-nh-self
Origin codes: i - IGP, e - EGP, ? - incomplete
```

```

- “show bgp ipv4 vpn x.x.x.x/x” for checking best path selected for specific VPNv4 destination

```
vyos@VyOS-RR1:~$ show bgp ipv4 vpn 10.0.0.100/32
BGP routing table entry for 10.80.80.1:1011:10.0.0.100/32
not allocated
Paths: (1 available, best #1)
  Advertised to non peer-group peers:
    10.0.0.7 10.0.0.8 10.0.0.9 10.0.0.10
    65035, (Received from a RR-client)
      10.0.0.8 from 10.0.0.8 (10.0.0.8)
      Origin incomplete, metric 0, localpref 100, valid, internal, best (First path_
↪received)
      Extended Community: RT:65035:1030
      Remote label: 80
      Last update: Tue Oct 19 13:45:32 202
```

Also we can verify how PE devices receives VPNv4 networks from the RRs and installing them to the specific customer VRFs:

- “show bgp ipv4 vpn summary” for checking iBGP neighbors against route-reflector devices:

```
vyos@VyOS-PE1:~$ show bgp ipv4 vpn summary
BGP router identifier 10.0.0.7, local AS number 65001 vrf-id 0
BGP table version 0
RIB entries 9, using 1728 bytes of memory
Peers 2, using 43 KiB of memory
Peer groups 1, using 64 bytes of memory

Neighbor      V      AS  MsgRcvd  MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd  ↪
↪PfxSnt
10.0.0.1      4      65001   8812    8794           0      0      0      0      ↪

- “show bgp vrf BLUE\_SPOKE summary” for checking EBGP neighbor information between PE and CE:

```
vyos@VyOS-PE1:~$ show bgp vrf BLUE_SPOKE summary
```

IPv4 Unicast Summary:

BGP router identifier 10.50.50.1, local AS number 65001 vrf-id 6

BGP table version 8

RIB entries 7, using 1344 bytes of memory

Peers 1, using 21 KiB of memory

Neighbor	V	AS	MsgRcvd	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
↪ PfxSnt									
10.50.50.2	4	65035	9019	9023			0 0	0	6d06h12m
↪ 1	4								

Total number of neighbors 1

- „show ip route vrf BLUE\_SPOKE“, um die RIB in unserem Spoke PE anzuzeigen.

Using this command we are also able to check the transport and customer label (inner/outer) for Hub network prefix (10.0.0.100/32):

```
vyos@VyOS-PE1:~$ show ip route vrf BLUE_SPOKE
```

Codes: K - kernel route, C - connected, S - static, R - RIP,

O - OSPF, I - IS-IS, B - BGP, E - EIGRP, N - NHRP,

T - Table, v - VNC, V - VNC-Direct, A - Babel, D - SHARP,

F - PBR, f - OpenFabric,

> - selected route, \* - FIB route, q - queued, r - rejected, b - backup

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
VRF BLUE_SPOKE:
K>* 0.0.0.0/0 [255/8192] unreachable (ICMP unreachable), 03w0d23h
C>* 10.50.50.0/24 is directly connected, eth3, 03w0d23h
B> 10.80.80.0/24 [200/0] via 10.0.0.8 (vrf default) (recursive), label 80, weight 1,
↪04:22:00
*
via 172.16.90.1, eth0 (vrf default), label 24/80, weight 1,
↪04:22:00
B>* 10.0.0.80/32 [20/0] via 10.50.50.2, eth3, weight 1, 6d05h30m
B> 10.0.0.100/32 [200/0] via 10.0.0.8 (vrf default) (recursive), label 80, weight 1,
↪04:22:00
*
via 172.16.90.1, eth0 (vrf default), label 24/80,
↪weight 1, 04:22:00
```

- **“show bgp ipv4 vpn x.x.x.x/32” for checking the best-path to the**  
specific VPNv4 destination including extended community and remotelabel information. This procedure is the same on all Spoke nodes:

```
vyos@VyOS-PE1:~$ show bgp ipv4 vpn 10.0.0.100/32
BGP routing table entry for 10.80.80.1:1011:10.0.0.100/32
not allocated
Paths: (2 available, best #1)
Not advertised to any peer
65035
10.0.0.8 from 10.0.0.1 (10.0.0.8)
Origin incomplete, metric 0, localpref 100, valid, internal, best (Neighbor IP)
Extended Community: RT:65035:1030
Originator: 10.0.0.8, Cluster list: 10.0.0.1
Remote label: 80
Last update: Tue Oct 19 13:45:26 2021
65035
10.0.0.8 from 10.0.0.2 (10.0.0.8)
Origin incomplete, metric 0, localpref 100, valid, internal

## 12.10 PPPoE over L2TP

This document is to describe a basic setup using PPPoE over L2TP. LAC and LNS are components of the broadband topology. LAC - L2TP access concentrator LNS - L2TP Network Server LAC and LNS forms L2TP tunnel. LAC receives packets from PPPoE clients and forward them to LNS. LNS is the termination point that comes from PPP packets from the remote client.

In this example we use VyOS 1.5 as LNS and Cisco IOS as LAC. All users with domain **vyos.io** will be tunneled to LNS via L2TP.

### 12.10.1 Network Topology

## 12.10.2 Configurations

### LAC

```

aaa new-model
!
aaa authentication ppp default local
!
vpdn enable
vpdn aaa attribute nas-ip-address vpdn-nas
!
vpdn-group LAC
 request-dialin
  protocol l2tp
  domain vyos.io
 initiate-to ip 192.168.139.100
 source-ip 192.168.139.101
 local name LAC
 l2tp tunnel password 0 test123
!
bba-group pppoe MAIN-BBA
 virtual-template 1
!
interface GigabitEthernet0/0
 description To LNS
 ip address 192.168.139.101 255.255.255.0
 duplex auto
 speed auto
 media-type rj45
!
interface GigabitEthernet0/1
 description To PPPoE clients
 no ip address
 duplex auto
 speed auto
 media-type rj45
 pppoe enable group MAIN-BBA
!

```

### LNS

```

set interfaces ethernet eth0 address '192.168.139.100/24'
set nat source rule 100 outbound-interface name 'eth0'
set nat source rule 100 source address '10.0.0.0/24'
set nat source rule 100 translation address 'masquerade'
set protocols static route 0.0.0.0/0 next-hop 192.168.139.2
set vpn l2tp remote-access authentication mode 'radius'
set vpn l2tp remote-access authentication radius server 192.168.139.110 key 'radiustest'
set vpn l2tp remote-access client-ip-pool TEST-POOL range '10.0.0.2-10.0.0.100'
set vpn l2tp remote-access default-pool 'TEST-POOL'
set vpn l2tp remote-access gateway-address '10.0.0.1'

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
set vpn l2tp remote-access lns host-name 'LAC'  
set vpn l2tp remote-access lns shared-secret 'test123'  
set vpn l2tp remote-access name-server '8.8.8.8'  
set vpn l2tp remote-access ppp-options disable-ccp
```

**Bemerkung:** This setup requires the Compression Control Protocol (CCP) being disabled, the command `set vpn l2tp remote-access ppp-options disable-ccp` accomplishes that.

## Client

In this lab we use Windows PPPoE client.

Settings

Broadband Connection

### Edit VPN connection

## 12.11 Inter-VRF Routing over VRF Lite

**Virtual Routing and Forwarding** is a technology that allow multiple instance of a routing table to exist within a single device. One of the key aspect of **VRFs** is that do not share the same routes or interfaces, therefore packets are forwarded between interfaces that belong to the same VRF only.

Any information related to a VRF is not exchanged between devices -or in the same device- by default, this is a technique called **VRF-Lite**.

Keep networks isolated is -in general- a good principle, but there are cases where you might need that some network can access other in a different VRF.

The scope of this document is to cover such cases in a dynamic way without the use of MPLS-LDP.

General information about L3VPNs can be found in the [L3VPN VRFs](#) chapter.

### 12.11.1 Overview

Let's say we have a requirement to have multiple networks.

- LAN 1
- LAN 2
- Management
- Internet

Both LANs have to be able to route between each other, both will have managed devices through a dedicated management network and both will need Internet access yet the LAN2 will need access to some set of outside networks, not all. The management network will need access to both LANs but cannot have access to/from the outside.

This scenario could be a nightmare applying regular routing and might need filtering in multiple interfaces.

A simple solution could be using different routing tables, or VRFs for all the networks so we can keep the routing restrictions. But for us to route between the different VRFs we would need a cable or a logical connection between each other:

- One cable/logical connection between LAN1 and LAN2
- One cable/logical connection between LAN1 and Internet
- One cable/logical connection between LAN2 and Internet
- One cable/logical connection between LAN1 and Management
- One cable/logical connection between LAN2 and Management

As we can see this is unpractical.

To address this scenario we will use to our advantage an extension of the BGP routing protocol that will help us in the “Export” between VRFs without the need for MPLS.

MP-BGP or MultiProtocol BGP introduces two main concepts to solve this limitation: - Route Distinguisher (RD): Is used to distinguish between different VRFs –called VPNs- inside the BGP Process. The RD is appended to each IPv4 Network that is advertised into BGP for that VPN making it a unique VPNv4 route. - Route Target (RT): This is an extended BGP community append to the VPNv4 route in the Import/Export process. When a route passes from the VRF routing table into the BGP process it will add the configured export extended community(ies) for that VPN. When that route needs to go from BGP into the VRF routing table will only pass if that given VPN import policy matches any of the appended community(ies) into that prefix.

## 12.11.2 Topology

## IP Schema

Device-A	Device-B	IPv4 Network	IPv6 Network
Core	LAN1	10.1.1.0/30	2001:db8::/127
Core	LAN2	172.16.2.0/30	2001:db8::2/127
Core	Management	192.168.3.0/30	2001:db8::4/127
Core	ISP	10.2.2.0/30	2001:db8::6/127

## RD & RT Schema

VRF	RD	RT
LAN1	64496:1	64496:1
LAN2	64496:2	64496:2
Management	64496:50	64496:50
Internet	64496:100	64496:100

### 12.11.3 Configurations

**Bemerkung:** We use a static route configuration in between the Core and each LAN and Management router, and BGP between the Core router and the ISP router but any dynamic routing protocol can be used.

#### Remote Networks

The following template configuration can be used in each remote router based in our topology.

```
# Interface Configuration
set interface eth eth<N> address <IP ADDRESS/CIDR>

# Static default route back to Core
set protocols static route 0.0.0.0/0 next-hop <CORE IP ADDRESS>
```

#### Core Router

##### Step 1: VRF and Configurations to remote networks

- Configuration

Set the VRF name and Table ID, set interface address and bind it to the VRF. Last add the static route to the remote network.

```
# VRF name and table ID (MANDATORY)
set vrf name <VRF> table <ID>

# Interface Configuration
set interface eth eth<N> address <IP ADDRESS/CIDR>

# Assign interface to VRF
set interface eth eth<N> vrf <VRF>

# Static route to remote Network
set vrf name <VRF> protocols static route <NETWORK/CIDR> next-hop <REMOTE IP ADDRESS>
```

- Verification

Checking the routing table of the VRF should reveal both static and connected entries active. A PING test between the Core and remote router is a way to validate connectivity within the VRF.

```
# show ip route vrf <VRF>
# show ipv6 route vrf <VRF>

vyos@Core:~$ show ip route vrf LAN1
Codes: K - kernel route, C - connected, S - static, R - RIP,
       O - OSPF, I - IS-IS, B - BGP, E - EIGRP, N - NHRP,
       T - Table, v - VNC, V - VNC-Direct, A - Babel, F - PBR,
       f - OpenFabric,
       > - selected route, * - FIB route, q - queued, r - rejected, b - backup
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

    t - trapped, o - offload failure

VRF LAN1:
S>* 10.0.0.0/24 [1/0] via 10.1.1.2, eth0, weight 1, 00:05:41
C>* 10.1.1.0/30 is directly connected, eth0, 00:05:44

vyos@Core:~$ show ipv6 route vrf LAN1
Codes: K - kernel route, C - connected, S - static, R - RIPng,
        O - OSPFv3, I - IS-IS, B - BGP, N - NHRP, T - Table,
        v - VNC, V - VNC-Direct, A - Babel, F - PBR,
        f - OpenFabric,
        > - selected route, * - FIB route, q - queued, r - rejected, b - backup
        t - trapped, o - offload failure

VRF LAN1:
C>* 2001:db8::/127 is directly connected, eth0, 00:18:43

rtt min/avg/max/mdev = 0.830/1.174/1.518/0.344 ms
vyos@Core:~$ ping 10.0.0.1 vrf LAN1
PING 10.0.0.1 (10.0.0.1) 56(84) bytes of data.
64 bytes from 10.0.0.1: icmp_seq=1 ttl=64 time=0.785 ms
64 bytes from 10.0.0.1: icmp_seq=2 ttl=64 time=0.948 ms
^C
--- 10.0.0.1 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1002ms
rtt min/avg/max/mdev = 0.785/0.866/0.948/0.081 ms

vyos@Core:~$ ping 2001:db8:0:1::1 vrf LAN1
PING 2001:db8:0:1::1(2001:db8:0:1::1) 56 data bytes
64 bytes from 2001:db8:0:1::1: icmp_seq=1 ttl=64 time=3.04 ms
64 bytes from 2001:db8:0:1::1: icmp_seq=2 ttl=64 time=1.04 ms
64 bytes from 2001:db8:0:1::1: icmp_seq=3 ttl=64 time=0.925 ms
^C
--- 2001:db8:0:1::1 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2004ms
rtt min/avg/max/mdev = 0.925/1.665/3.035/0.969 ms

```

## Step 2: BGP Configuration for VRF-Lite

- Configuration

Setting BGP global local-as as well inside the VRF. Redistribute static routes to inject configured networks into the BGP process but still inside the VRF.

```
# set BGP global local-as
set protocols bgp system-as <ASN>

# set BGP VRF local-as and redistribution
set vrf name <VRF> protocols bgp system-as <ASN>
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> redistribute static
```

- Verification

Check the BGP VRF table and verify if the static routes are injected showing the correct next-hop information.

```
# show ip bgp vrf <VRF>
# show bgp vrf <VRF> ipv6

vyos@Core:~$ show ip bgp vrf LAN1
BGP table version is 3, local router ID is 10.1.1.1, vrf id 8
Default local pref 100, local AS 64496
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
               i internal, r RIB-failure, S Stale, R Removed
Nexthop codes: @NNN nexthop's vrf id, < announce-nh-self
Origin codes: i - IGP, e - EGP, ? - incomplete
RPKI validation codes: V valid, I invalid, N Not found

   Network          Next Hop           Metric LocPrf Weight Path
*> 10.0.0.0/24      10.1.1.2             0           32768 ?

vyos@Core# run show bgp vrf LAN1 ipv6
BGP table version is 13, local router ID is 10.1.1.1, vrf id 8
Default local pref 100, local AS 64496
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
               i internal, r RIB-failure, S Stale, R Removed
Nexthop codes: @NNN nexthop's vrf id, < announce-nh-self
Origin codes: i - IGP, e - EGP, ? - incomplete
RPKI validation codes: V valid, I invalid, N Not found

   Network          Next Hop           Metric LocPrf Weight Path
*> 2001:db8:0:1::/64
                        2001:db8::1             0           32768 ?
```

### Step 3: VPN Configuration

- Configuration

Within the VRF we set the Route-Distinguisher (RD) and Route-Targets (RT), then we enable the export/import VPN.

```
# set Route-distinguisher
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> rd vpn export '<RD>'

# set route-target for import/export
# Note: RT are a list that can be more than one community between apostrophe
#       and separated by blank space. Ex: '<RT:1> <RT:2> <RT:3>'
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> route-target vpn export '
↳<RT:Export>'
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> route-target vpn import '
↳<RT:Import>'

# Enable VPN export/import under this VRF
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> export vpn
set vrf name <VRF> protocols bgp address-family <AF IPv4/IPv6> import vpn
```

A key point to understand is that if we need two VRFs to communicate between each other EXPORT rt from VRF1 has to be in the IMPORT rt list from VRF2. But this is only in ONE direction, to complete the communication the EXPORT rt from VRF2 has to be in the IMPORT rt list from VRF1.

There are some cases where this is not needed -for example, in some DDoS appliance- but most inter-vrf routing designs use the above configurations.

- Verification

After configured all the VRFs involved in this topology we take a deeper look at both BGP and Routing table for the VRF LAN1

```
# show ip bgp vrf <VRF>
# show bgp vrf <VRF> ipv6

vyos@Core# run show ip bgp vrf LAN1
BGP table version is 53, local router ID is 10.1.1.1, vrf id 8
Default local pref 100, local AS 64496
Status codes: s suppressed, d damped, h history, * valid, > best, = multipath,
               i internal, r RIB-failure, S Stale, R Removed
Next hop codes: @NNN nexthop's vrf id, < announce-nh-self
Origin codes: i - IGP, e - EGP, ? - incomplete
RPKI validation codes: V valid, I invalid, N Not found
```

Network	Next Hop	Metric	LocPrf	Weight	Path

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

t - trapped, o - offload failure

VRF LAN1:
B>* ::/0 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1, 00:07:50
C>* 2001:db8::/127 is directly connected, eth0, 05:33:43
B>* 2001:db8::6/127 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↪ 00:07:50
S>* 2001:db8:0:1::/64 [1/0] via 2001:db8::1, eth0, weight 1, 05:31:03
B>* 2001:db8:0:3::/64 [20/0] via 2001:db8::5, eth2 (vrf Management), weight 1, 00:07:50
B>* 2001:db8:1::/48 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↪ 00:07:50
B>* 2001:db8:2::/48 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↪ 00:07:50
B>* 2001:db8:3::/48 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↪ 00:07:50
C>* fe80::/64 is directly connected, eth0, 05:33:43

```

As we can see in the BGP table any imported route has been injected with a „@“ followed by the VPN id; In the routing table of the VRF, if the route was installed, we can see -between round brackets- the exported VRF table.

#### Step 4: End to End verification

Now we perform some end-to-end testing

- From Management to LAN1/LAN2

```

3 packets transmitted, 3 received, 0% packet loss, time 2003ms
rtt min/avg/max/mdev = 1.949/2.915/4.815/1.343 ms
```

## 12.11.4 Conclusions

Inter-VRF routing is a well-known solution to address complex routing scenarios that enable -in a dynamic way- to leak routes between VRFs. It is recommended to take special consideration while designing route-targets and its application as it can minimize future interventions while creating a new VRF will automatically take the desired effect in its propagation.

## 12.11.5 Appendix-A

### Full configuration from all devices

- Core

```
set interfaces ethernet eth0 address '10.1.1.1/30'
set interfaces ethernet eth0 address '2001:db8::/127'

## 12.11.6 Appendix-B

### Route-Filtering

When importing routes using MP-BGP it is possible to filter a subset of them before are injected in the BGP table. One of the most common case is to use a route-map with an prefix-list.

- Configuration

We create a prefix-list first and add all the routes we need to.

```
# set both ipv4 and ipv6 policies

set policy prefix-list LAN2-Internet rule 1 action 'permit'
set policy prefix-list LAN2-Internet rule 1 le '24'
set policy prefix-list LAN2-Internet rule 1 prefix '198.51.0.0/16'
set policy prefix-list LAN2-Internet rule 2 action 'permit'
set policy prefix-list LAN2-Internet rule 2 prefix '192.0.2.0/24'
set policy prefix-list LAN2-Internet rule 3 action 'permit'
set policy prefix-list LAN2-Internet rule 3 prefix '192.168.0.0/24'
set policy prefix-list LAN2-Internet rule 4 action 'permit'
set policy prefix-list LAN2-Internet rule 4 prefix '10.0.0.0/24'

set policy prefix-list6 LAN2-Internet-v6 rule 1 action 'permit'
set policy prefix-list6 LAN2-Internet-v6 rule 1 prefix '2001:db8:1::/48'
set policy prefix-list6 LAN2-Internet-v6 rule 2 action 'permit'
set policy prefix-list6 LAN2-Internet-v6 rule 2 prefix '2001:db8:2::/48'
set policy prefix-list6 LAN2-Internet-v6 rule 3 action 'permit'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
set policy prefix-list6 LAN2-Internet-v6 rule 3 prefix '2001:db8:0:3::/64'
set policy prefix-list6 LAN2-Internet-v6 rule 4 action 'permit'
set policy prefix-list6 LAN2-Internet-v6 rule 4 prefix '2001:db8:0:1::/64'
```

Then add a route-map and reference to above prefix. Consider that the actions taken inside the prefix will MATCH the routes that will be affected by the actions inside the rules of the route-map.

```
set policy route-map LAN2-Internet rule 1 action 'permit'
set policy route-map LAN2-Internet rule 1 match ip address prefix-list 'LAN2-Internet'

set policy route-map LAN2-Internet-v6 rule 1 action 'permit'
set policy route-map LAN2-Internet-v6 rule 1 match ipv6 address prefix-list 'LAN2-
↳ Internet-v6'
```

We are using a „white list“ approach by allowing only what is necessary. In case that need to implement a „black list“ approach then you will need to change the action in the route-map for a deny BUT you need to add a rule that permits the rest due to the implicit deny in the route-map.

Then we need to attach the policy to the BGP process. This needs to be under the import statement in the vrf we need to filter.

```
set vrf name LAN2 protocols bgp address-family ipv4-unicast route-map vpn import 'LAN2-
↳ Internet'
set vrf name LAN2 protocols bgp address-family ipv6-unicast route-map vpn import 'LAN2-
↳ Internet-v6'
```

- Verification

```
# show ip route vrf LAN2

B>* 10.0.0.0/24 [20/0] via 10.1.1.2, eth0 (vrf LAN1), weight 1, 00:45:28
S>* 172.16.0.0/24 [1/0] via 172.16.2.2, eth1, weight 1, 00:45:32
C>* 172.16.2.0/30 is directly connected, eth1, 00:45:39
B>* 192.0.2.0/24 [20/0] via 10.2.2.2, eth3 (vrf Internet), weight 1, 00:45:24
B>* 192.168.0.0/24 [20/0] via 192.168.3.2, eth2 (vrf Managment), weight 1, 00:45:27
B>* 198.51.100.0/24 [20/0] via 10.2.2.2, eth3 (vrf Internet), weight 1, 00:45:24

# show ipv6 route vrf LAN2

C>* 2001:db8::2/127 is directly connected, eth1, 00:46:26
B>* 2001:db8:0:1::/64 [20/0] via 2001:db8::1, eth0 (vrf LAN1), weight 1, 00:46:17
S>* 2001:db8:0:2::/64 [1/0] via 2001:db8::3, eth1, weight 1, 00:46:21
B>* 2001:db8:0:3::/64 [20/0] via 2001:db8::5, eth2 (vrf Managment), weight 1, 00:46:16
B>* 2001:db8:1::/48 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↳ 00:46:13
B>* 2001:db8:2::/48 [20/0] via fe80::5200:ff:fe02:3, eth3 (vrf Internet), weight 1,
↳ 00:46:13
C>* fe80::/64 is directly connected, eth1, 00:46:27
```

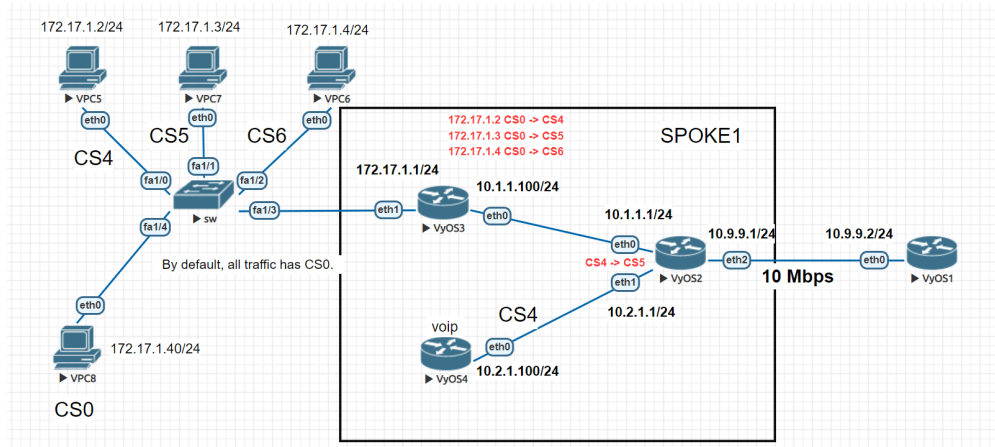

As we can see even if both VRF LAN1 and LAN2 has the same import RTs we are able to select which routes are effectively imported and installed.

## 12.12 QoS example

### 12.12.1 Configuration ,dscp' and shaper using QoS

In this case, we'll try to make a simple lab using QoS and the general ability of the VyOS system. We recommend you to go through the main article about [QoS](#) first.

Using the general schema for example:

We have four hosts on the local network 172.17.1.0/24. All hosts are labeled CS0 by default. We need to replace labels on all hosts except vpc8. We will replace the labels on the nearest router “VyOS3” using the IP addresses of the sources.

- 172.17.1.2 CS0 -> CS4
- 172.17.1.3 CS0 -> CS5
- 172.17.1.4 CS0 -> CS6
- 172.17.1.40 CS0 by default

Next, we will replace only all CS4 labels on the “VyOS2” router.

- CS4 -> CS5

In the end, we will configure the traffic shaper using QoS mechanisms on the “VYOS2” router.

### 12.12.2 Configuration:

Set IP addresses on all VPCs and a default gateway 172.17.1.1. We'll use in this case only static routes. On the VyOS3 router, we need to change the ,dscp' labels for the VPCs. To do this, we use this configuration.

```
set interfaces ethernet eth0 address '10.1.1.100/24'
set interfaces ethernet eth1 address '172.17.1.1/24'
set protocols static route 0.0.0.0/0 next-hop 10.1.1.1
set qos policy shaper vyos3 class 10 match ADDRESS10 ip source address '172.17.1.2/32'
set qos policy shaper vyos3 class 10 set-dscp 'CS4'
set qos policy shaper vyos3 class 20 match ADDRESS20 ip source address '172.17.1.3/32'
set qos policy shaper vyos3 class 20 set-dscp 'CS5'
set qos policy shaper vyos3 class 30 match ADDRESS20 ip source address '172.17.1.4/32'
set qos policy shaper vyos3 class 30 set-dscp 'CS6'
set qos policy shaper vyos3 default bandwidth '10%'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

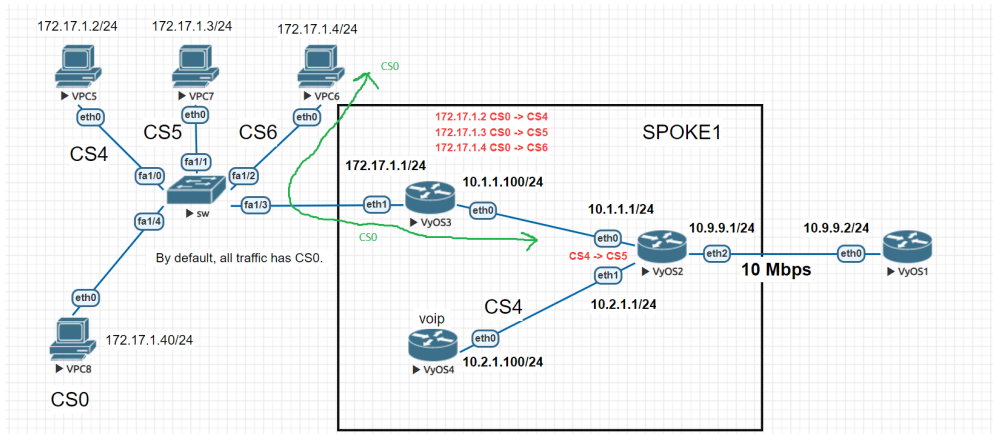

set qos policy shaper vyos3 default ceiling '100%'
set qos policy shaper vyos3 default priority '7'
set qos policy shaper vyos3 default queue-type 'fair-queue'
set qos interface eth0 egress 'vyos3'

```

Main rules:

- ADDRESS10 change CS0 -> CS4 source 172.17.1.2/32
- ADDRESS20 change CS0 -> CS5 source 172.17.1.3/32
- ADDRESS30 change CS0 -> CS6 source 172.17.1.4/32

Check the result

Before the interface eth0 on router VyOS3

```

> Frame 19: 98 bytes on wire (784 bits), 98 bytes captured (784 bits) on interface 0
> Ethernet II, Src: Private_66:68:06 (00:50:79:66:68:06), Dst: 50:0d:00:03:00:01 (50:0d:00:03:00:01)
> Internet Protocol Version 4, Src: 172.17.1.4, Dst: 10.9.9.2
    0100 .... = Version: 4
    .... 0101 = Header Length: 20 bytes (5)
    > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)

```

After the interface eth0 on router VyOS3

```

> Frame 3: 98 bytes on wire (784 bits), 98 bytes captured (784 bits) on interface 0
> Ethernet II, Src: 50:0d:00:03:00:00 (50:0d:00:03:00:00), Dst: 50:0d:00:02:00:00 (50:0d:00:02:00:00)
> Internet Protocol Version 4, Src: 172.17.1.4, Dst: 10.9.9.2
    0100 .... = Version: 4
    .... 0101 = Header Length: 20 bytes (5)
    > Differentiated Services Field: 0xc0 (DSCP: CS6, ECN: Not-ECT)

```

On the router, VyOS4 set all traffic as CS4. We have to configure the default class and class for changing all labels from CS0 to CS4

```

set interfaces ethernet eth0 address '10.2.1.100/24'
set protocols static route 0.0.0.0/0 next-hop 10.2.1.1
set qos policy shaper vyos4 class 10 bandwidth '100%'
set qos policy shaper vyos4 class 10 burst '15k'
set qos policy shaper vyos4 class 10 match ALL ether protocol 'all'
set qos policy shaper vyos4 class 10 queue-type 'fair-queue'
set qos policy shaper vyos4 class 10 set-dscp 'CS4'
set qos policy shaper vyos4 default bandwidth '10%'

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set qos policy shaper vyos4 default burst '15k'
set qos policy shaper vyos4 default ceiling '100%'
set qos policy shaper vyos4 default priority '7'
set qos policy shaper vyos4 default queue-type 'fair-queue'
set qos interface eth0 egress 'vyos4'

```

Next on the router VyOS2 we will change labels on all incoming traffic only from CS4-> CS6

```

set interfaces ethernet eth0 address '10.1.1.1/24'
set interfaces ethernet eth1 address '10.2.1.1/24'
set interfaces ethernet eth2 address '10.9.9.1/24'
set protocols static route 172.17.1.0/24 next-hop 10.1.1.100
set qos policy shaper vyos2 class 10 bandwidth '100%'
set qos policy shaper vyos2 class 10 burst '15k'
set qos policy shaper vyos2 class 10 match VYOS2 ip dscp 'CS4'
set qos policy shaper vyos2 class 10 queue-type 'fair-queue'
set qos policy shaper vyos2 class 10 set-dscp 'CS5'
set qos policy shaper vyos2 default bandwidth '100%'
set qos policy shaper vyos2 default burst '15k'
set qos policy shaper vyos2 default ceiling '100%'
set qos policy shaper vyos2 default priority '7'
set qos policy shaper vyos2 default queue-type 'fair-queue'
set qos interface eth2 egress 'vyos2'

```

- 172.17.1.2/24 CS0

```
> Frame 4: 98 bytes on wire (784 bits), 98 bytes captured (784 bits) on interface 0
> Ethernet II, Src: Private_66:68:05 (00:50:79:66:68:05), Dst: 50:0d:00:03:00:01 (50:0d:00:03:00:01)
> Internet Protocol Version 4, Src: 172.17.1.2, Dst: 10.9.9.2
  0100 .... = Version: 4
  .... 0101 = Header Length: 20 bytes (5)
  > Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
```

- 172.17.1.2/24 CS0 -> CS4

```
> Frame 3: 98 bytes on wire (784 bits), 98 bytes captured (784 bits) on interface 0
> Ethernet II, Src: 50:0d:00:03:00:00 (50:0d:00:03:00:00), Dst: 50:0d:00:02:00:00 (50:0d:00:02:00:00)
> Internet Protocol Version 4, Src: 172.17.1.2, Dst: 10.9.9.2
  0100 .... = Version: 4
  .... 0101 = Header Length: 20 bytes (5)
  > Differentiated Services Field: 0x80 (DSCP: CS4, ECN: Not-ECT)
```

- 172.17.1.2/24 CS4 -> CS5

```
> Frame 1: 98 bytes on wire (784 bits), 98 bytes captured (784 bits) on interface 0
> Ethernet II, Src: 50:0d:00:02:00:02 (50:0d:00:02:00:02), Dst: 50:0d:00:01:00:00 (50:0d:00:01:00:00)
> Internet Protocol Version 4, Src: 172.17.1.2, Dst: 10.9.9.2
  0100 .... = Version: 4
  .... 0101 = Header Length: 20 bytes (5)
  > Differentiated Services Field: 0xa0 (DSCP: CS5, ECN: Not-ECT)
```

In the end, on the router “VyOS2” we will set outgoing bandwidth limits between the “VyOS3” and “VyOS1” routers. Let’s set a limit for IP 10.1.1.100 = 5 Mbps(Tx). We will check the result of the work with the help of the “iPerf” utility.

Set up bandwidth limits on the eth2 interface of the router “VyOS2”.

```
vyos@vyos2# show qos policy shaper vynos2 class 20
bandwidth 5mbit
description "for VyOS3 eth0"
match VyOS3 {
  ip {
    source {
      address 10.1.1.100/32
    }
  }
}
```

Check the result.

```

[ 4] 0.00-1.31 sec 1 datagram received out-of-order

```

As we see shaper is working and the traffic will not work over 5 Mbit/s.

## 12.13 Segment-routing IS-IS example

When utilizing VyOS in an environment with Cisco IOS-XR gear you can use this blue print as an initial setup to get MPLS ISIS-SR working between those two devices. The lab was build using EVE-NG.

Abb. 1: ISIS-SR example network

The below configuration is used as example where we keep focus on VyOS-P1/VyOS-P2/XRv-P3 which we share the settings.

### 12.13.1 Configuration

- VyOS-P1:

```
set interfaces dummy dum0 address '192.0.2.1/32'
set interfaces ethernet eth1 address '192.0.2.5/30'
set interfaces ethernet eth1 mtu '8000'
set interfaces ethernet eth3 address '192.0.2.21/30'
set interfaces ethernet eth3 mtu '8000'
set protocols isis interface dum0 passive
set protocols isis interface eth1 network point-to-point
set protocols isis interface eth3 network point-to-point
set protocols isis level 'level-2'
set protocols isis log-adjacency-changes
set protocols isis metric-style 'wide'
set protocols isis net '49.0000.0000.0000.0001.00'
set protocols isis segment-routing maximum-label-depth '8'
set protocols isis segment-routing prefix 192.0.2.1/32 index value '1'
set protocols mpls interface 'eth1'
set protocols mpls interface 'eth3'
set system host-name 'P1-VyOS'
```

- XRv-P3:

```
hostname P3-VyOS
interface Loopback0
  ipv4 address 192.0.2.3 255.255.255.255
!
interface GigabitEthernet0/0/0/1
  mtu 8014
  ipv4 address 192.0.2.6 255.255.255.252
!
interface GigabitEthernet0/0/0/2
  mtu 8014
  ipv4 address 192.0.2.18 255.255.255.252
!
router isis VyOS
  is-type level-2-only
  net 49.0000.0000.0000.0003.00
  log adjacency changes
  address-family ipv4 unicast
  metric-style wide
  segment-routing mpls
!
interface Loopback0
  passive
  address-family ipv4 unicast
  prefix-sid index 3
!
!
interface GigabitEthernet0/0/0/1
  point-to-point
  address-family ipv4 unicast
!
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
!
interface GigabitEthernet0/0/0/2
  point-to-point
  address-family ipv4 unicast
  !
!
!
```

- VyOS-P2:

```
set interfaces dummy dum0 address '192.0.2.2/32'
set interfaces ethernet eth2 address '192.0.2.17/30'
set interfaces ethernet eth2 mtu '8000'
set interfaces ethernet eth3 address '192.0.2.26/30'
set interfaces ethernet eth3 mtu '8000'
set protocols isis interface dum0 passive
set protocols isis interface eth2 network point-to-point
set protocols isis interface eth3 network point-to-point
set protocols isis level 'level-2'
set protocols isis log-adjacency-changes
set protocols isis metric-style 'wide'
set protocols isis net '49.0000.0000.0000.0002.00'
set protocols isis segment-routing maximum-label-depth '8'
set protocols isis segment-routing prefix 192.0.2.2/32 index value '2'
set protocols mpls interface 'eth2'
set protocols mpls interface 'eth3'
set system host-name 'P2-VyOS'
```

This gives us MPLS segment routing enabled and labels forwarding :

```
vyos@P1-VyOS:~$ show mpls table
Inbound Label  Type           Nexthop                               Outbound Label
-----
15000          SR (IS-IS)    192.0.2.6                             implicit-null
15001          SR (IS-IS)    192.0.2.22                            implicit-null

VyOS is able to check MSD per devices:

```
vyos@P1-VyOS:~$ show isis segment-routing node
Area VyOS:
IS-IS L1 SR-Nodes:
```

IS-IS L2 SR-Nodes:

System ID	SRGB	SRLB	Algorithm	MSD
0000.0000.0001	16000 - 23999	15000 - 15999	SPF	8
0000.0000.0002	16000 - 23999	15000 - 15999	SPF	8
0000.0000.0003	16000 - 23999	0 - 4294967295	SPF	10
0000.0000.0011	16000 - 23999	15000 - 15999	SPF	8

```
vyos@P2-VyOS:~$ show isis segment-routing node
Area VyOS:
IS-IS L1 SR-Nodes:
```

IS-IS L2 SR-Nodes:

System ID	SRGB	SRLB	Algorithm	MSD
0000.0000.0001	16000 - 23999	15000 - 15999	SPF	8
0000.0000.0002	16000 - 23999	15000 - 15999	SPF	8
0000.0000.0003	16000 - 23999	0 - 4294967295	SPF	10
0000.0000.0011	16000 - 23999	15000 - 15999	SPF	8

Here is the routing tables showing the MPLS segment routing label operations:

```
vyos@P1-VyOS:~$ show ip route isis

```

## 12.14 NMP example

Consider how to quickly set up NMP and VyOS for monitoring. NMP is multi-vendor network monitoring from 'SolarWinds' built to scale and expand with the needs of your network.

### 12.14.1 Configuration 'VyOS'

First prepare our VyOS router for connection to NMP. We have to set up the SNMP protocol and connectivity between the router and NMP.

```
set interfaces ethernet eth0 address 'dhcp'
set system name-server '8.8.8.8'
set service snmp community router authorization 'test'
set service snmp community router network '0.0.0.0/0'
```

## 12.14.2 Configuration ,NMP‘

Next, you just should follow the pictures:

The first screenshot shows the SolarWinds 'Summary Home' dashboard. The 'SETTINGS' menu is open, and 'Manage Nodes' is highlighted with a red box.

The second screenshot shows the 'Manage Nodes' page. The 'ADD NODE' button is highlighted with a red box.

The third screenshot shows the 'Add Node' configuration page. The 'Polling Hostname or IP Address' field is set to '192.0.2.2'. The 'Polling Method' is set to 'Most Devices: SNMP and ICMP'. The 'SNMP Version' is set to 'SNMPv2c', the 'SNMP Port' is '161', and the 'Community String' is 'router'. The 'TEST' button is highlighted with a red box, and a 'Test Successful' message is visible.

### Change Properties

Change properties or keep defaults. Select OK, Add Node to add this new node to Orion

Name:

Polling IP Address:

Polling Method:

[Help me choose a polling method](#)

☐ **External Node: No Status**  
No data is collected for this node. Useful for monitoring a hosted application or other element on the node but not the node itself.

☐ **Status Only: ICMP**  
Limited data (status, response time, and packet loss) is collected using ICMP (ping). Useful for devices which do not support SNMP or WMI.

☒ **Most Devices: SNMP and ICMP**  
Standard polling method for network devices such as switches and routers, as well as Unix/Linux servers.

SNMP Version:

SNMP Port:

☒ Allow 64 bit counters

Community String:  Press down arrow to view all

Read/Write Community String:

☐ **Windows Servers: WMI and ICMP**  
Recommended agentless polling method for Windows servers.

☐ **Windows & Unix/Linux Servers: Agent**  
Optional agent useful for monitoring Windows & Unix/Linux hosts in remote or distributed environments, such as the cloud. Credentials are needed only for installing already. [What is an agent?](#)

The screenshot shows the SolarWinds Orion configuration page for a node. The 'Node Thresholds' section is expanded, showing various metrics like CPU Load, Memory Usage, Response Time, and Percent Packet Loss, each with warning and critical thresholds. Below this, the 'Log and Event Monitoring' section is visible, with a status dropdown set to 'Default'. At the bottom right of this section, the 'OK, ADD NODE' button is highlighted with a red rectangle.

SSH Port: 22  
Port in which ssh service is running

Node Thresholds

CPU Load ☐ Override Orion General Thresholds

Warning: greater than or equal to 80 %  
Critical: greater than or equal to 90 %  
Capacity Trending: Calculate exhaustion using average daily values

Memory Usage ☐ Override Orion General Thresholds

Warning: greater than or equal to 80 %  
Critical: greater than or equal to 90 %  
Capacity Trending: Calculate exhaustion using average daily values

Response Time ☐ Override Orion General Thresholds

Warning: greater than or equal to 500 ms  
Critical: greater than or equal to 1000 ms

Percent Packet Loss ☐ Override Orion General Thresholds

Warning: greater than or equal to 30 %  
Critical: greater than or equal to 50 %

CLI Polling Settings: ☐ Enable CLI Polling - Learn More  
Enables polling for Cisco Nexus, Cisco ASA and Palo Alto firewalls to discover VPNs, high availability and more.  
Note: Cisco ASAs are not supported by Orion Remote Collector.

Log and Event Monitoring

Status: Default  
Choose one of the following options: Learn More

- Default - Monitoring will be enabled for this node on receipt of the first syslog message or SNMP trap.
- Enabled - Monitoring is enabled for this node.
- Disabled - Monitoring is disabled for this node, log and event data will be discarded for this node.

BACK OK, ADD NODE CANCEL

Memory buffers		
Cached memory		
Thread memory		

In the end, you'll get a powerful instrument for monitoring the VyOS systems.

## 12.15 Ansible example

### 12.15.1 Setting up Ansible on a server running the Debian operating system.

In this example, we will set up a simple use of Ansible to configure multiple VyOS routers. We have four pre-configured routers with this configuration:

Using the general schema for example:

We have four pre-configured routers with this configuration:

```
set interfaces ethernet eth0 address dhcp
set service ssh
commit
save
```

- vyos7 - 192.0.2.105
- vyos8 - 192.0.2.106
- vyos9 - 192.0.2.107
- vyos10 - 192.0.2.108

### 12.15.2 Install Ansible:

```
# apt-get install ansible
Do you want to continue? [Y/n] y
```

### 12.15.3 Install Paramiko:

```
#apt-get install -y python3-paramiko
```

### 12.15.4 Check the version:

```
# ansible --version
ansible 2.10.8
config file = None
configured module search path = ['/root/.ansible/plugins/modules', '/usr/share/ansible/
↳ plugins/modules']
ansible python module location = /usr/lib/python3/dist-packages/ansible
executable location = /usr/bin/ansible
python version = 3.9.2 (default, Feb 28 2021, 17:03:44) [GCC 10.2.1 20210110]
```

### 12.15.5 Basic configuration of ansible.cfg:

```
# nano /root/ansible.cfg
[defaults]
host_key_checking = no
```

### 12.15.6 Add all the VyOS hosts:

```
# nano /root/hosts
[vyos_hosts]
vyos7 ansible_ssh_host=192.0.2.105
vyos8 ansible_ssh_host=192.0.2.106
vyos9 ansible_ssh_host=192.0.2.107
vyos10 ansible_ssh_host=192.0.2.108
```

### 12.15.7 Add general variables:

```
# mkdir /root/group_vars/
# nano /root/group_vars/vyos_hosts
ansible_python_interpreter: /usr/bin/python3
ansible_network_os: vyos
ansible_connection: network_cli
ansible_user: vyos
ansible_ssh_pass: vyos
```

### 12.15.8 Add a simple playbook with the tasks for each router:

```
# nano /root/main.yml

---
- hosts: vyos_hosts
gather_facts: 'no'
tasks:
  - name: Configure general settings for the vyos hosts group
    vyos_config:
      lines:
        - set system name-server 8.8.8.8
        - set interfaces ethernet eth0 description '#WAN#'
        - set interfaces ethernet eth1 description '#LAN#'
        - set interfaces ethernet eth2 disable
        - set interfaces ethernet eth3 disable
        - set system host-name {{ inventory_hostname }}
      save:
        true
```

### 12.15.9 Start the playbook:

```
ansible-playbook -i hosts main.yml
PLAY [vyos_hosts] *****

TASK [Configure general settings for the vyos hosts group] *****
ok: [vyos9]
ok: [vyos10]
ok: [vyos7]
ok: [vyos8]

PLAY RECAP *****
vyos10                : ok=2    changed=0    unreachable=0    failed=0    skipped=0_
↳ rescued=0    ignored=0
vyos7                  : ok=2    changed=0    unreachable=0    failed=0    skipped=0_
↳ rescued=0    ignored=0
vyos8                  : ok=2    changed=0    unreachable=0    failed=0    skipped=0_
↳ rescued=0    ignored=0
vyos9                  : ok=2    changed=0    unreachable=0    failed=0    skipped=0_
↳ rescued=0    ignored=0
```

### 12.15.10 Check the result on the vyos10 router:

```
vyos@vyos10:~$ show interfaces
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
eth0           192.0.2.108/24  u/u   WAN
eth1           -               u/u   LAN
eth2           -               A/D
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
eth3          -          A/D
lo            127.0.0.1/8  u/u
               ::1/128
```

```
vyos@vyos10:~$ sh configuration commands | grep 8.8.8.8
set system name-server '8.8.8.8'
```

### 12.15.11 The simple way without configuration of the hostname (one task for all routers):

```
# nano /root/hosts_v2
[vyos_hosts_group]
vyos7 ansible_ssh_host=192.0.2.105
vyos8 ansible_ssh_host=192.0.2.106
vyos9 ansible_ssh_host=192.0.2.107
vyos10 ansible_ssh_host=192.0.2.108
[vyos_hosts_group:vars]
ansible_python_interpreter=/usr/bin/python3
ansible_user=vyos
ansible_ssh_pass=vyos
ansible_network_os=vyos
ansible_connection=network_cli

# nano /root/main_v2.yml
---
- hosts: vyos_hosts_group

connection: network_cli
gather_facts: 'no'

tasks:
  - name: Configure remote vyos_hosts_group
    vyos_config:
      lines:
        - set system name-server 8.8.8.8
        - set interfaces ethernet eth0 description WAN
        - set interfaces ethernet eth1 description LAN
        - set interfaces ethernet eth2 disable
        - set interfaces ethernet eth3 disable
      save:
        true
```

```
# ansible-playbook -i hosts_v2 main_v2.yml

PLAY [vyos_hosts_group] *****

TASK [Configure remote vyos_hosts_group] *****
ok: [vyos8]
ok: [vyos7]
ok: [vyos9]
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

ok: [vyos10]

PLAY RECAP *****
vyos10                : ok=1    changed=0    unreachable=0    failed=0    skipped=0
↳ rescued=0    ignored=0
vyos7                  : ok=1    changed=0    unreachable=0    failed=0    skipped=0
↳ rescued=0    ignored=0
vyos8                  : ok=1    changed=0    unreachable=0    failed=0    skipped=0
↳ rescued=0    ignored=0
vyos9                  : ok=1    changed=0    unreachable=0    failed=0    skipped=0
↳ rescued=0    ignored=0

```

In the next chapter of the example, we'll use Ansible with jinja2 templates and variables.

## 12.16 Policy-Based Site-to-Site VPN and Firewall Configuration

This guide shows an example policy-based IKEv2 site-to-site VPN between two VyOS routers, and firewall configuration.

For simplicity, configuration and tests are done only using IPv4, and firewall configuration is done only on one router.

### 12.16.1 Network Topology and requirements

This configuration example and the requirements consists of:

- Two VyOS routers with public IP address.
- 2 private subnets on each site.
- Local subnets should be able to reach internet using source NAT.
- Communication between private subnets should be done through IPSec tunnel without NAT.
- Configuration of basic firewall in one site, in order to:
  - Protect the router on ,WAN‘ interface, allowing only IPSec connections and SSH access from trusted IPs.
  - Allow access to the router only from trusted networks.
  - Allow DNS requests only for local networks.
  - Allow ICMP on all interfaces.
  - Allow all new connections from local subnets.
  - Allow connections from LANs to LANs through the tunnel.

## 12.16.2 Configuration

Interface and routing configuration:

```
# LEFT router:
set interfaces ethernet eth0 address '198.51.100.14/30'
set interfaces ethernet eth1 vif 111 address '10.1.11.1/24'
set interfaces ethernet eth2 vif 112 address '10.1.12.1/24'
set protocols static route 0.0.0.0/0 next-hop 198.51.100.13

# RIGHT router:
set interfaces ethernet eth0 address '192.0.2.130/30'
set interfaces ethernet eth1 vif 221 address '10.2.21.1/24'
set interfaces ethernet eth2 vif 222 address '10.2.22.1/24'
```

IPsec configuration:

```
# LEFT router:
set vpn ipsec authentication psk RIGHT id '198.51.100.14'
set vpn ipsec authentication psk RIGHT id '192.0.2.130'
set vpn ipsec authentication psk RIGHT secret 'p4ssw0rd'
set vpn ipsec esp-group ESP-GROUP mode 'tunnel'
set vpn ipsec esp-group ESP-GROUP proposal 1 encryption 'aes256'
set vpn ipsec esp-group ESP-GROUP proposal 1 hash 'sha256'
set vpn ipsec ike-group IKE-GROUP key-exchange 'ikev2'
set vpn ipsec ike-group IKE-GROUP proposal 1 dh-group '14'
set vpn ipsec ike-group IKE-GROUP proposal 1 encryption 'aes256'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set vpn ipsec ike-group IKE-GROUP proposal 1 hash 'sha256'
set vpn ipsec interface 'eth0'
set vpn ipsec site-to-site peer RIGHT authentication mode 'pre-shared-secret'
set vpn ipsec site-to-site peer RIGHT connection-type 'initiate'
set vpn ipsec site-to-site peer RIGHT default-esp-group 'ESP-GROUP'
set vpn ipsec site-to-site peer RIGHT ike-group 'IKE-GROUP'
set vpn ipsec site-to-site peer RIGHT local-address '198.51.100.14'
set vpn ipsec site-to-site peer RIGHT remote-address '192.0.2.130'
set vpn ipsec site-to-site peer RIGHT tunnel 0 local prefix '10.1.11.0/24'
set vpn ipsec site-to-site peer RIGHT tunnel 0 remote prefix '10.2.21.0/24'
set vpn ipsec site-to-site peer RIGHT tunnel 1 local prefix '10.1.11.0/24'
set vpn ipsec site-to-site peer RIGHT tunnel 1 remote prefix '10.2.22.0/24'
set vpn ipsec site-to-site peer RIGHT tunnel 2 local prefix '10.1.12.0/24'

set vpn ipsec site-to-site peer LEFT tunnel 3 local prefix '10.2.22.0/24'
set vpn ipsec site-to-site peer LEFT tunnel 3 remote prefix '10.1.12.0/24'

```

## Firewall Configuration:

```

# Firewall Groups:
set firewall group network-group LOCAL-NETS network '10.1.11.0/24'
set firewall group network-group LOCAL-NETS network '10.1.12.0/24'
set firewall group network-group REMOTE-NETS network '10.2.21.0/24'
set firewall group network-group REMOTE-NETS network '10.2.22.0/24'
set firewall group network-group TRUSTED network '198.51.100.125/32'

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set firewall group network-group TRUSTED network '203.0.113.0/24'
set firewall group network-group TRUSTED network '10.1.11.0/24'
set firewall group network-group TRUSTED network '192.168.70.0/24'

# Forward traffic: default drop and only allow what is needed
set firewall ipv4 forward filter default-action 'drop'

# Forward traffic: global state policies
set firewall ipv4 forward filter rule 1 action 'accept'
set firewall ipv4 forward filter rule 1 state established 'enable'
set firewall ipv4 forward filter rule 1 state related 'enable'
set firewall ipv4 forward filter rule 2 action 'drop'
set firewall ipv4 forward filter rule 2 state invalid 'enable'

# Forward traffic: Accept all connections from local networks
set firewall ipv4 forward filter rule 10 action 'accept'
set firewall ipv4 forward filter rule 10 source group network-group 'LOCAL-NETS'

# Forward traffic: accept connections from remote LANs to local LANs
set firewall ipv4 forward filter rule 20 action 'accept'
set firewall ipv4 forward filter rule 20 destination group network-group 'LOCAL-NETS'
set firewall ipv4 forward filter rule 20 source group network-group 'REMOTE-NETS'

# Input traffic: default drop and only allow what is needed
set firewall ipv4 input filter default-action 'drop'

# Input traffic: global state policies
set firewall ipv4 input filter rule 1 action 'accept'
set firewall ipv4 input filter rule 1 state established 'enable'
set firewall ipv4 input filter rule 1 state related 'enable'
set firewall ipv4 input filter rule 2 action 'drop'
set firewall ipv4 input filter rule 2 state invalid 'enable'

# Input traffic: add rules needed for ipsec connection
set firewall ipv4 input filter rule 10 action 'accept'
set firewall ipv4 input filter rule 10 destination port '500,4500'
set firewall ipv4 input filter rule 10 inbound-interface interface-name 'eth0'
set firewall ipv4 input filter rule 10 protocol 'udp'
set firewall ipv4 input filter rule 15 action 'accept'
set firewall ipv4 input filter rule 15 inbound-interface interface-name 'eth0'
set firewall ipv4 input filter rule 15 protocol 'esp'

# Input traffic: accept ssh connection from trusted ips
set firewall ipv4 input filter rule 20 action 'accept'
set firewall ipv4 input filter rule 20 destination port '22'
set firewall ipv4 input filter rule 20 protocol 'tcp'
set firewall ipv4 input filter rule 20 source group network-group 'TRUSTED'

# Input traffic: accept dns requests only from local networks.
set firewall ipv4 input filter rule 25 action 'accept'
set firewall ipv4 input filter rule 25 destination port '53'
set firewall ipv4 input filter rule 25 protocol 'udp'

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set firewall ipv4 input filter rule 25 source group network-group 'LOCAL-NETS'

# Input traffic: allow icmp
set firewall ipv4 input filter rule 30 action 'accept'
set firewall ipv4 input filter rule 30 protocol 'icmp'

```

And NAT Configuration:

```

set nat source rule 10 destination group network-group 'REMOTE-NETS'
set nat source rule 10 exclude
set nat source rule 10 outbound-interface name 'eth0'
set nat source rule 10 source group network-group 'LOCAL-NETS'
set nat source rule 20 outbound-interface name 'eth0'
set nat source rule 20 source group network-group 'LOCAL-NETS'
set nat source rule 20 translation address 'masquerade'

```

### 12.16.3 Checking through op-mode commands

After some testing, we can check IPSec status, and counter on every tunnel:

```

vyos@LEFT:~$ show vpn ipsec sa

```

Connection	State	Uptime	Bytes In/Out	Packets In/Out	Remote address
↳ Remote ID	Proposal				
RIGHT-tunnel-0	up	36m24s	840B/840B	10/10	192.0.2.130
↳ 192.0.2.130	AES_CBC_256/HMAC_SHA2_256_128/MODP_2048				
RIGHT-tunnel-1	up	36m33s	588B/588B	7/7	192.0.2.130
↳ 192.0.2.130	AES_CBC_256/HMAC_SHA2_256_128/MODP_2048				
RIGHT-tunnel-2	up	35m50s	1K/1K	15/15	192.0.2.130
↳ 192.0.2.130	AES_CBC_256/HMAC_SHA2_256_128/MODP_2048				
RIGHT-tunnel-3	up	36m54s	2K/2K	32/32	192.0.2.130
↳ 192.0.2.130	AES_CBC_256/HMAC_SHA2_256_128/MODP_2048				

```

vyos@LEFT:~$

```

Also, we can check firewall counters:

```

vyos@LEFT:~$ show firewall
Rulesets Information

```

Rule	Action	Protocol	Packets	Bytes	Conditions
1	accept	all	681	96545	ct state { established, related }
↳ accept					
2	drop	all	0	0	ct state invalid
10	accept	all	360	27205	ip saddr @N_LOCAL-NETS accept
20	accept	all	8	648	ip daddr @N_LOCAL-NETS ip saddr @N_

## 12.17 Site-to-Site IPSec VPN to Cisco using FlexVPN

This guide shows a sample configuration for FlexVPN site-to-site Internet Protocol Security (IPsec)/Generic Routing Encapsulation (GRE) tunnel.

FlexVPN is a newer „solution“ for deployment of VPNs and it utilizes IKEv2 as the key exchange protocol. The result is a flexible and scalable VPN solution that can be easily adapted to fit various network needs. It can also support a variety of encryption methods, including AES and 3DES.

The lab was built using EVE-NG.

### 12.17.1 Configuration

#### VyOS

- GRE:

```
set interfaces tunnel tun1 encapsulation 'gre'
set interfaces tunnel tun1 ip adjust-mss '1336'
set interfaces tunnel tun1 mtu '1376'
set interfaces tunnel tun1 remote '10.1.1.6'
set interfaces tunnel tun1 source-address '88.2.2.1'
```

- IPsec:

```
set vpn ipsec authentication psk vyos_cisco_1 id 'vyos.net'
set vpn ipsec authentication psk vyos_cisco_1 id 'cisco.hub.net'
set vpn ipsec authentication psk vyos_cisco_1 secret 'secret'
set vpn ipsec esp-group e1 lifetime '3600'
set vpn ipsec esp-group e1 mode 'tunnel'
set vpn ipsec esp-group e1 pfs 'disable'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

set vpn ipsec esp-group e1 proposal 1 encryption 'aes128'
set vpn ipsec esp-group e1 proposal 1 hash 'sha256'
set vpn ipsec ike-group i1 key-exchange 'ikev2'
set vpn ipsec ike-group i1 lifetime '28800'
set vpn ipsec ike-group i1 proposal 1 dh-group '5'
set vpn ipsec ike-group i1 proposal 1 encryption 'aes256'
set vpn ipsec ike-group i1 proposal 1 hash 'sha256'
set vpn ipsec interface 'eth2'
set vpn ipsec options disable-route-autoinstall
set vpn ipsec options flexvpn
set vpn ipsec options interface 'tun1'
set vpn ipsec options virtual-ip
set vpn ipsec site-to-site peer cisco_hub authentication local-id 'vyos.net'
set vpn ipsec site-to-site peer cisco_hub authentication mode 'pre-shared-secret'
set vpn ipsec site-to-site peer cisco_hub authentication remote-id 'cisco.hub.net'
set vpn ipsec site-to-site peer cisco_hub connection-type 'initiate'
set vpn ipsec site-to-site peer cisco_hub default-esp-group 'e1'
set vpn ipsec site-to-site peer cisco_hub ike-group 'i1'
set vpn ipsec site-to-site peer cisco_hub local-address '88.2.2.1'
set vpn ipsec site-to-site peer cisco_hub remote-address '10.1.1.6'
set vpn ipsec site-to-site peer cisco_hub tunnel 1 local prefix '88.2.2.1/32'
set vpn ipsec site-to-site peer cisco_hub tunnel 1 protocol 'gre'
set vpn ipsec site-to-site peer cisco_hub tunnel 1 remote prefix '10.1.1.6/32'
set vpn ipsec site-to-site peer cisco_hub virtual-address '0.0.0.0'

```

## Cisco

```

aaa new-model
!
!
aaa authorization network default local
!
crypto ikev2 name-mangler GET_DOMAIN
  fqdn all
  email all
!
!
crypto ikev2 authorization policy vyos
  pool mypool
  aaa attribute list mylist
  route set interface
  route accept any tag 100 distance 5

crypto ikev2 keyring mykeys
  peer peer1
    identity fqdn vyos.net
    pre-shared-key local secret
    pre-shared-key remote secret
crypto ikev2 profile my_profile
  match identity remote fqdn vyos.net

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
identity local fqdn cisco.hub.net
authentication remote pre-share
authentication local pre-share
keyring local mykeys
dpd 10 3 periodic
aaa authorization group psk list local name-mangler GET_DOMAIN
aaa authorization user psk cached
virtual-template 1
!
!
!
crypto ipsec transform-set TSET esp-aes esp-sha256-hmac
mode tunnel
!
!
crypto ipsec profile my-ipsec-profile
set transform-set TSET
set ikev2-profile my_profile
!
interface Virtual-Template1 type tunnel
no ip address
ip mtu 1376
ip nhrp network-id 1
ip nhrp shortcut virtual-template 1
ip tcp adjust-mss 1336
tunnel path-mtu-discovery
tunnel protection ipsec profile my-ipsec-profile
!
ip local pool my_pool 172.16.122.1 172.16.122.254
```

Since the tunnel is a point-to-point GRE tunnel, it behaves like any other point-to-point interface (for example: serial, dialer), and it is possible to run any Interior Gateway Protocol (IGP)/Exterior Gateway Protocol (EGP) over the link in order to exchange routing information

## 12.17.2 Verification

```
vyos@vyos$ show interfaces
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description

## Configuration Blueprints (autotest)

---

The next pages contains automatic full tested configuration examples.

Each lab will build an test from an external script. The page content will generate, so changes will not take an effect.

A host `vyos-oobm` will use as a ssh proxy. This host is just necessary for the Lab test.

The process will do the following steps:

1. create the lab on a eve-ng server
2. configure each host in the lab
3. do some defined tests
4. optional do an upgrade to a higher version and do step 3 again.
5. generate the documentation and include files
6. shutdown and destroy the lab, if there is no error

### 13.1 DHCP Relay trough GRE-Bridge

Testdate: 2023-05-11

Version: 1.4-rolling-202305100734

This simple structure shows how to configure a DHCP Relay over a GRE Bridge interface.

### 13.1.1 Topology

The topology has 3 VyOS routers and one client. Between the DHCP Server and the DHCP Relay is a GRE tunnel. The *transport* VyOS represent a large Network.

## DHCP Relay trough GRE-Bridge

### 13.1.2 Configuration

First, we configure the transport network and the Tunnel interface.

Transport:

```
set interfaces ethernet eth1 address '10.0.10.254/24'
set interfaces ethernet eth2 address '10.0.20.254/24'
```

DHCP-Server

```
set interfaces ethernet eth1 address '10.0.20.10/24'
set interfaces tunnel tun100 address '172.16.0.1/30'
set interfaces tunnel tun100 encapsulation 'gretap'
set interfaces tunnel tun100 remote '10.0.10.10'
set interfaces tunnel tun100 source-address '10.0.20.10'
set protocols static route 0.0.0.0/0 next-hop 172.16.0.2
set protocols static route 10.0.10.0/24 next-hop 10.0.20.254
set protocols static route 192.168.0.0/24 next-hop 127.16.0.2
```

DHCP-Relay

```
set interfaces ethernet eth1 address '10.0.10.10/24'
set interfaces ethernet eth2 address '192.168.0.254/24'
set interfaces tunnel tun100 address '172.16.0.2/30'
set interfaces tunnel tun100 encapsulation 'gretap'
set interfaces tunnel tun100 remote '10.0.20.10'
set interfaces tunnel tun100 source-address '10.0.10.10'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
set protocols static route 0.0.0.0/0 next-hop 172.16.0.1
set protocols static route 10.0.20.0/24 next-hop 10.0.10.254
```

After this, we need the DHCP-Server and Relay configuration. To get a testable result, we just have one IP in the DHCP range. Expand it as you need it.

#### DHCP-Server

```
set service dhcp-server listen-address '172.16.0.1'
set service dhcp-server shared-network-name DHCPTun100 authoritative
set service dhcp-server shared-network-name DHCPTun100 subnet 192.168.0.0/24 option-
↳ default-router '192.168.0.254'
set service dhcp-server shared-network-name DHCPTun100 subnet 192.168.0.0/24 range 0
↳ start '192.168.0.30'
set service dhcp-server shared-network-name DHCPTun100 subnet 192.168.0.0/24 range 0
↳ stop '192.168.0.30'
```

#### DHCP-Relay

```
set service dhcp-relay interface 'eth2'
set service dhcp-relay interface 'tun100'
```

### 13.1.3 Test the result

Ping the Client from the DHCP Server.

```
vyos@dhcp-server:~$ ping 192.168.0.30 count 4
PING 192.168.0.30 (192.168.0.30) 56(84) bytes of data.
64 bytes from 192.168.0.30: icmp_seq=1 ttl=63 time=1.02 ms
64 bytes from 192.168.0.30: icmp_seq=2 ttl=63 time=1.06 ms
64 bytes from 192.168.0.30: icmp_seq=3 ttl=63 time=1.21 ms
64 bytes from 192.168.0.30: icmp_seq=4 ttl=63 time=1.16 ms

--- 192.168.0.30 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3004ms
rtt min/avg/max/mdev = 1.016/1.112/1.214/0.077 ms
```

And show all DHCP Leases

```
vyos@dhcp-server:~$ show dhcp server leases
IP Address      MAC address      State   Lease start      Lease expiration
↳ Remaining     Pool             Hostname
-----
↳ -----
192.168.0.30    00:50:79:66:68:05 active   2023/05/11 13:08:50 2023/05/12 13:08:50
↳ 23:59:16      DHCPTun100      VPCS
```

## 13.2 Tunnelbroker.net (IPv6)

Testdate: 2024-01-13

Version: 1.5-rolling-202401121239

This guide walks through the setup of <https://www.tunnelbroker.net/> for an IPv6 Tunnel.

### 13.2.1 Prerequisites

- A public, routable IPv4 address. This does not necessarily need to be static, but you will need to update the tunnel endpoint when/if your IP address changes, which can be done with a script and a scheduled task.
- Account at <https://www.tunnelbroker.net/>
- Requested a „Regular Tunnel“. You want to choose a location that is closest to your physical location for the best response time.

### Topology

The example topology has 2 VyOS routers. One as The WAN Router and on as a Client, to test a single LAN setup

### Configuration

First, we configure the vyos-wan interface to get a DHCP address.

```
set interfaces ethernet eth1 address dhcp
```

Now we are able to setup the tunnel interface.

```
set interfaces tunnel tun0 address '2001:470:6c:779::2/64' #Tunnelbroker Client IPv6
↪address
set interfaces tunnel tun0 description 'HE.NET IPv6 Tunnel'
set interfaces tunnel tun0 encapsulation 'sit'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
set interfaces tunnel tun0 remote '216.66.86.114' #Tunnelbroker Server IPv4 address
set interfaces tunnel tun0 source-address '172.29.129.60' # Tunnelbroker Client IPv4
↪ address. See note below
```

**Bemerkung:** The *source-address* is the Tunnelbroker client IPv4 address or if there is NAT the current WAN interface address.

If *source-address* is dynamic, the tunnel will cease working once the address changes. To avoid having to manually update *source-address* each time the dynamic IP changes, an address of ,0.0.0.0' can be specified.

Setup the IPv6 default route to the tunnel interface

```
set protocols static route6 ::/0 interface tun0
```

Now you should be able to ping a public IPv6 Address

```
vyos@vyos-wan:~$ ping 2001:470:20::2 count 4
PING 2001:470:20::2(2001:470:20::2) 56 data bytes
64 bytes from 2001:470:20::2: icmp_seq=1 ttl=64 time=33.8 ms
64 bytes from 2001:470:20::2: icmp_seq=2 ttl=64 time=43.9 ms
64 bytes from 2001:470:20::2: icmp_seq=3 ttl=64 time=43.4 ms
64 bytes from 2001:470:20::2: icmp_seq=4 ttl=64 time=42.5 ms

--- 2001:470:20::2 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 2999ms
rtt min/avg/max/mdev = 33.802/40.920/43.924/4.139 ms
```

Assuming the pings are successful, you need to add some DNS servers. Some options:

```
set system name-server 2001:470:20::2 #Tunnelbroker DNS Server
```

You should now be able to ping something by IPv6 DNS name:

```
vyos@vyos-wan:~$ ping tunnelbroker.net count 4
PING tunnelbroker.net(tunnelbroker.net (2001:470:0:63::2)) 56 data bytes
64 bytes from tunnelbroker.net (2001:470:0:63::2): icmp_seq=1 ttl=48 time=285 ms
64 bytes from tunnelbroker.net (2001:470:0:63::2): icmp_seq=2 ttl=48 time=186 ms
64 bytes from tunnelbroker.net (2001:470:0:63::2): icmp_seq=3 ttl=48 time=178 ms
64 bytes from tunnelbroker.net (2001:470:0:63::2): icmp_seq=4 ttl=48 time=177 ms

--- tunnelbroker.net ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3002ms
rtt min/avg/max/mdev = 176.707/206.638/285.128/45.457 ms
```

## LAN Configuration

At this point, your VyOS install should have full IPv6, but now your LAN devices need access.

With Tunnelbroker.net, you have two options:

- Routed /64. This is the default assignment. In IPv6-land, it's good for a single „LAN“, and is somewhat equivalent to a /24.
- Routed /48. This is something you can request by clicking the „Assign /48“ link in the Tunnelbroker.net tunnel config. It allows you to have up to 65k

Unlike IPv4, IPv6 is really not designed to be broken up smaller than /64. So if you ever want to have multiple LANs, VLANs, DMZ, etc, you'll want to ignore the assigned /64, and request the /48 and use that.

### 13.2.2 Single LAN Setup

Single LAN setup where eth2 is your LAN interface. Use the Tunnelbroker Routed /64 prefix:

```
set interface ethernet eth2 address '2001:470:6d:778::1/64' # Tunnelbroker Routed /64
↪prefix
set service router-advert interface eth2 name-server '2001:470:20::2'
set service router-advert interface eth2 prefix 2001:470:6d:778::/64 # Tunnelbroker
↪Routed /64 prefix
```

Please note, ,autonomous-flag‘ and ,on-link-flag‘ are enabled by default, ,valid-lifetime‘ and ,preferred-lifetime‘ are set to default values of 30 days and 4 hours respectively.

And the client to receive an IPv6 address with stateless autoconfig.

```
set interfaces ethernet eth1 ipv6 address autoconf
```

This accomplishes a few things:

- Sets your LAN interface's IP address
- Enables router advertisements. This is an IPv6 alternative for DHCP (though DHCPv6 can still be used). With RAs, Your devices will automatically find the information they need for routing and DNS.

Now the Client is able to ping a public IPv6 address

```
vyos@client:~$ ping 2001:470:20::2 count 4
PING 2001:470:20::2(2001:470:20::2) 56 data bytes
64 bytes from 2001:470:20::2: icmp_seq=1 ttl=63 time=32.1 ms
64 bytes from 2001:470:20::2: icmp_seq=2 ttl=63 time=41.8 ms
64 bytes from 2001:470:20::2: icmp_seq=3 ttl=63 time=41.7 ms
64 bytes from 2001:470:20::2: icmp_seq=4 ttl=63 time=47.1 ms

--- 2001:470:20::2 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3005ms
rtt min/avg/max/mdev = 32.128/40.688/47.107/5.403 ms
```

### 13.2.3 Multiple LAN/DMZ Setup

That's how you can expand the example above. Use the *Routed /48* information. This allows you to assign a different /64 to every interface, LAN, or even device. Or you could break your network into smaller chunks like /56 or /60.

The format of these addresses:

- *2001:470:xxxx::/48*: The whole subnet. xxxx should come from Tunnelbroker.
- *2001:470:xxxx:1::/64*: A subnet suitable for a LAN
- *2001:470:xxxx:2::/64*: Another subnet
- *2001:470:xxxx:ffff:/64*: The last usable /64 subnet.

In the above examples, 1,2,ffff are all chosen by you. You can use 1-ffff (1-65535).

So, when your LAN is eth1, your DMZ is eth2, your cameras are on eth3, etc:

```
set interfaces ethernet eth1 address '2001:470:xxxx:1::1/64'
set service router-advert interface eth1 name-server '2001:470:20::2'
set service router-advert interface eth1 prefix 2001:470:xxxx:1::/64

set interfaces ethernet eth2 address '2001:470:xxxx:2::1/64'
set service router-advert interface eth2 name-server '2001:470:20::2'
set service router-advert interface eth2 prefix 2001:470:xxxx:2::/64

set interfaces ethernet eth3 address '2001:470:xxxx:3::1/64'
set service router-advert interface eth3 name-server '2001:470:20::2'
set service router-advert interface eth3 prefix 2001:470:xxxx:3::/64
```

Please note, ,autonomous-flag' and ,on-link-flag' are enabled by default, ,valid-lifetime' and ,preferred-lifetime' are set to default values of 30 days and 4 hours respectively.

### 13.2.4 Firewall

Finally, don't forget the firewall. The usage is identical, except for instead of *set firewall name NAME*, you would use *set firewall ipv6-name NAME*.

Similarly, to attach the firewall, you would use *set interfaces ethernet eth0 firewall in ipv6-name* or *set firewall zone LOCAL from WAN firewall ipv6-name*.

## 13.3 L3VPN EVPN with VyOS

Testdate: 2023-05-11

Version: 1.4-rolling-202305100734

I spun up a new lab in EVE-NG, which represents this as the „Foo Bar - Service Provider Inc.“ that has 3 points of presence (PoP) in random datacenters/sites named PE1, PE2, and PE3. Each PoP aggregates at least two customers.

I named the customers blue, red and green which is common practice in VRF (Virtual Routing and Forwarding) documentation scenarios.

- PE1 is located in an industrial area that holds multiple office buildings. All customers have a site in this area.
- PE2 is located in a smaller area where by coincidence two customers (blue and red) share an office building.

- PE3 is located in a smaller area where by coincidence two customers (blue and green) are located.

### 13.3.1 Management VRF

A brief excursion into VRFs: This has been one of the longest-standing feature requests of VyOS (dating back to 2016) which can be described as „a VLAN for layer 2 is what a VRF is for layer 3“. With VRFs, a router/system can hold multiple, isolated routing tables on the same system. If you wonder what's the difference between multiple tables that people used for policy-based routing since forever, it's that a VRF also isolates connected routes rather than just static and dynamically learned routes, so it allows NICs in different VRFs to use conflicting network ranges without issues.

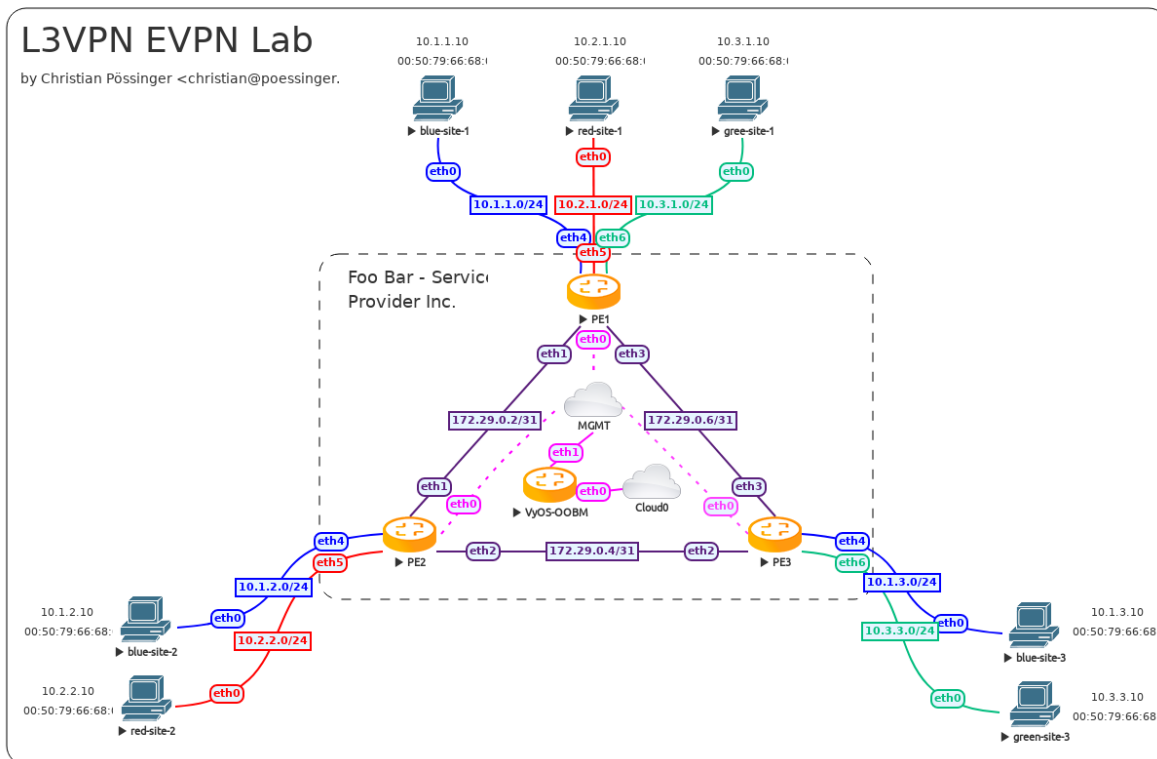

VyOS 1.3 added initial support for VRFs (including IPv4/IPv6 static routing) and VyOS 1.4 now enables full dynamic routing protocol support for OSPF, IS-IS, and BGP for individual VRFs.

The lab I built is using a VRF (called **mgmt**) to provide out-of-band SSH access to the PE (Provider Edge) routers.

```
set system host-name PE1
set interfaces ethernet eth0 address 'dhcp'
set interfaces ethernet eth0 description 'out-of-band management'
set interfaces ethernet eth0 vrf 'mgmt'
set service ssh vrf 'mgmt'
set vrf name mgmt table '1000'
```

### 13.3.2 Topology

We use the following network topology in this example:

### 13.3.3 Core network

I chose to run OSPF as the IGP (Interior Gateway Protocol). All required BGP sessions are established via a dummy interfaces (similar to the loopback, but in Linux you can have only one loopback, while there can be many dummy interfaces) on the PE routers. In case of a link failure, traffic is diverted in the other direction in this triangle setup and BGP sessions will not go down. One could even enable BFD (Bidirectional Forwarding Detection) on the links for a faster failover and resilience in the network.

Regular VyOS users will notice that the BGP syntax has changed in VyOS 1.4 from even the prior post about this subject. This is due to T1711, where it was finally decided to get rid of the redundant BGP ASN (Autonomous System Number) specification on the CLI and move it to a single leaf node (set protocols bgp local-as).

It's important to note that all your existing configurations will be migrated automatically on image upgrade. Nothing to do on your side.

PE1

```

```

### 13.3.4 Tenant networks (VRFs)

Once all routers can be safely remotely managed and the core network is operational, we can now setup the tenant networks.

Every tenant is assigned an individual VRF that would support overlapping address ranges for customers blue, red and green. In our example, we do not use overlapping ranges to make it easier when showing debug commands.

Thus you can easily match it to one of the devices/networks below.

Every router that provides access to a customer network needs to have the customer network (VRF + VNI) configured. To make our own lives easier, we utilize the same VRF table id (local routing table number) and VNI (Virtual Network Identifier) per tenant on all our routers.

- blue uses local routing table id and VNI 2000
- red uses local routing table id and VNI 3000
- green uses local routing table id and VNI 4000

PE1

```

set interfaces vxlan vxlan2000 mtu '1500'

## 13.4 Wireguard

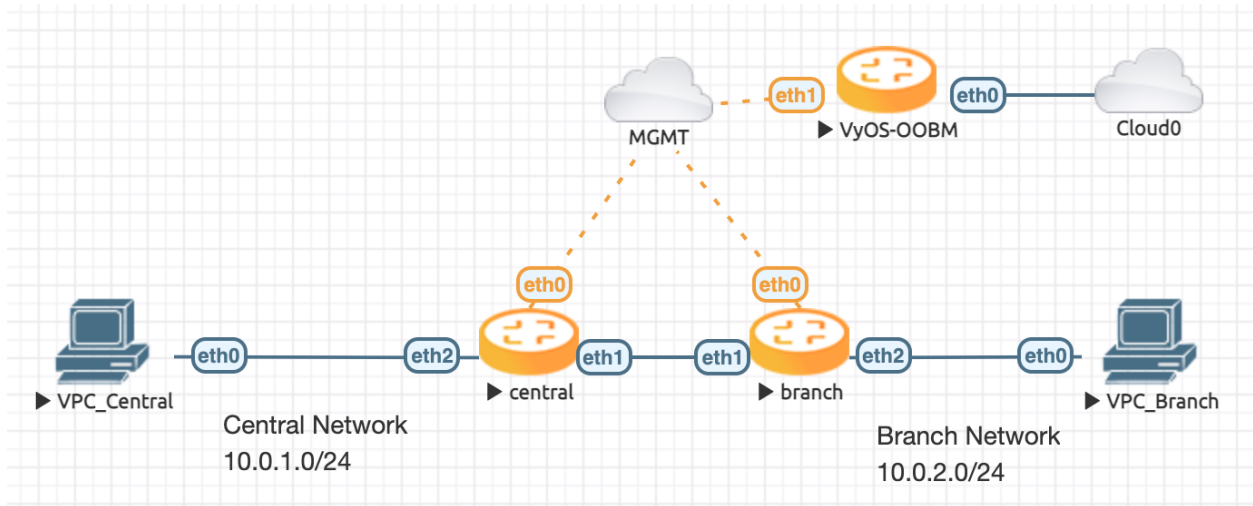

Testdate: 2024-01-13

Version: 1.5-rolling-202401121239

This simple structure show how to connect two offices. One remote branch and the central office.

### 13.4.1 Topology

The topology have a central and a branch VyOS router and one client, to test, in each site.

### 13.4.2 Configuration

Set the local subnet on eth2 and the public ip address eth1 on each site.

Central

```
set interface ethernet eth2 address 10.0.1.254/24
set interface ethernet eth1 address 198.51.100.1/24
```

Branch

```
set interface ethernet eth2 address 10.0.2.254/24
set interface ethernet eth1 address 198.51.100.2/24
```

Next thing to do, is to create a wireguard keypair on each side. After this, the public key can be displayed, to save for later.

```
vyos@central:~$ generate pki wireguard
Private key: wHQS+ib3eMIp2DxRiAeXfFVaSCMMP1YHBaKfSR1xfV8=
Public key: RCMY6BAER0uEcPvspUb3K38MHyHJpK5kiV5IOX943HI=
```

After you have each public key. The wireguard interfaces can be setup.

Central

```
set interfaces wireguard wg01 private-key 'wHQS+ib3eMIp2DxRiAeXfFVaSCMMP1YHBaKfSR1xfV8='
set interfaces wireguard wg01 address 192.168.0.1/24
set interfaces wireguard wg01 description 'VPN-to-Branch'
set interfaces wireguard wg01 peer branch allowed-ips 10.0.2.0/24
set interfaces wireguard wg01 peer branch allowed-ips 192.168.0.0/24
set interfaces wireguard wg01 peer branch address 198.51.100.2
set interfaces wireguard wg01 peer branch port 51820
set interfaces wireguard wg01 peer branch public-key 'nWhMTjGQbQiJwaNqHpZ/'
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
↪p8+iAH29HaJDnsdfsRdW9As='
set interfaces wireguard wg01 port 51820
```

Branch

```
set interfaces wireguard wg01 private-key 'QM3ZtmaxstxIDoz00AVLE/F/UVjmdcrOvfKYW/TVw18='
set interfaces wireguard wg01 address 192.168.0.2/24
set interfaces wireguard wg01 description 'VPN-to-central'
set interfaces wireguard wg01 peer central allowed-ips 10.0.1.0/24
set interfaces wireguard wg01 peer central allowed-ips 192.168.0.0/24
set interfaces wireguard wg01 peer central address 198.51.100.1
set interfaces wireguard wg01 peer central port 51820
set interfaces wireguard wg01 peer central public-key
↪'RCMy6BAER0uEcPvspUb3K38MHyHJpK5kiV5IOX943HI='
set interfaces wireguard wg01 port 51820
```

To reach the network, a route must be set on each VyOS host. In this structure, a static interface route will fit the requirements.

Central

```
set protocols static route 10.0.2.0/24 interface wg01
```

Branch

```
set protocols static route 10.0.1.0/24 interface wg01
```

### 13.4.3 Testing and debugging

After all is done and commit, let's take a look if the Wireguard interface is up and running.

```
vyos@central:~$ show interfaces wireguard
Codes: S - State, L - Link, u - Up, D - Down, A - Admin Down
Interface      IP Address      S/L  Description
-----
wg01           192.168.0.1/24  u/u  VPN-to-Branch
```

And ping the Branch PC from your central router to check the response.

```
vyos@central:~$ ping 10.0.2.100 count 4
PING 10.0.2.100 (10.0.2.100) 56(84) bytes of data.
64 bytes from 10.0.2.100: icmp_seq=1 ttl=63 time=0.894 ms
64 bytes from 10.0.2.100: icmp_seq=2 ttl=63 time=0.869 ms
64 bytes from 10.0.2.100: icmp_seq=3 ttl=63 time=0.966 ms
64 bytes from 10.0.2.100: icmp_seq=4 ttl=63 time=0.998 ms

--- 10.0.2.100 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3004ms
rtt min/avg/max/mdev = 0.869/0.931/0.998/0.052 ms
```

## 13.5 OpenVPN with LDAP

Testdate: 2023-05-11

Version: 1.4-rolling-202305100734

This LAB shows how to use OpenVPN with a Active Directory authentication method.

**Topology consists of:**

- Windows Server 2019 with a running Active Directory
- VyOS as a OpenVPN Server
- VyOS as Client

### 13.5.1 Active Directory on Windows server

The lab assumes a full running Active Directory on the Windows Server. Here are some PowerShell commands to quickly add a Test Active Directory.

```
# install the Active Directory Server role
Install-WindowsFeature AD-Domain-Services -IncludeManagementTools

# install the Active Directory Server role
Install-ADDSForest -DomainName "vyos.local" -DomainNetBiosName "VYOS" -InstallDns:$true -
↳ NoRebootCompletion:$true

# create test user01 and binduser
New-ADUser binduser -AccountPassword(Read-Host -AsSecureString "Input Password") -
↳ Enabled $true
New-ADUser user01 -AccountPassword(Read-Host -AsSecureString "Input Password") -Enabled
↳ $true
```

### 13.5.2 Configure VyOS as OpenVPN Server

In this example OpenVPN will be setup with a client certificate and username / password authentication.

First a CA, a signed server and client certificate and a Diffie-Hellman parameter must be generated and installed. Please look [here](#) for more information.

Add the LDAP plugin configuration file `/config/auth/ldap-auth.config`

Check all possible settings [here](#)

```
<LDAP>
URL ldap://192.168.1.10
BindDN bind_user@vyos.local
Password P4ssw0rd123
Timeout 15
TLSEnable no
FollowReferrals no
</LDAP>
<Authorization>
BaseDN "DC=vyos,DC=local"
SearchFilter "sAMAccountName=%u"
RequireGroup false
</Authorization>
```

Now generate all required certificates on the ovpn-server:

First the CA

```
vyos@ovpn-server# run generate pki ca install OVPN-CA
```

after this create a signed server and a client certificate

```
vyos@ovpn-server# run generate pki certificate sign OVPN-CA install SRV
vyos@ovpn-server# run generate pki certificate sign OVPN-CA install CLIENT
```

and last the DH Key

```
vyos@ovpn-server# run generate pki dh install DH
```

after all these steps the config look like this:

```
set pki ca OVPN-CA certificate
  ↪ 'MIIFnTCCA4WgAwIBAgIUIPFIXvCxYdavCnSPFNjr6lUtlsswDQYJKoZIhvcNAQELBQAwVzELMAkGA1UEBhMCR0IxZzARBgNVBAGM

```

Once all the required certificates and keys are installed, the remaining OpenVPN Server configuration can be carried out.

```

set interface ethernet eth1 address '192.168.1.1/24'
set interface ethernet eth2 address '198.51.100.254/24'
set interfaces openvpn vtun10 local-host '198.51.100.254'
set interfaces openvpn vtun10 local-port '1194'
set interfaces openvpn vtun10 mode 'server'
set interfaces openvpn vtun10 openvpn-option '--plugin /usr/lib/openvpn/openvpn-auth-
→ ldap.so /config/auth/ldap-auth.config'
set interfaces openvpn vtun10 persistent-tunnel
set interfaces openvpn vtun10 protocol 'udp'
set interfaces openvpn vtun10 server push-route '192.168.1.0/24'
set interfaces openvpn vtun10 server subnet '10.23.1.0/24'

set interfaces openvpn vtun10 tls ca-certificate OVPN-CA
set interfaces openvpn vtun10 tls certificate SRV
set interfaces openvpn vtun10 tls dh-params DH
set protocols static route 10.1.1.0/24 interface vtun10

```

### 13.5.3 Client configuration

One advantage of having the client certificate stored is the ability to create the client configuration.

```

vyos@ovpn-server:~$ generate openvpn client-config interface vtun10 ca OVPN-CA_
→ certificate CLIENT

```

save the output to a file and import it in nearly all openvpn clients.

```

client
nobind
remote 198.51.100.254 1194
remote-cert-tls server
proto udp
dev tun
dev-type tun
persist-key
persist-tun
verb 3

# Encryption options

keysize 256

```

&lt;/key&gt;

## Configure VyOS as client

```
set interfaces openvpn vtun10 authentication username 'user01'
set interfaces openvpn vtun10 authentication password '$secret'
set interfaces openvpn vtun10 encryption cipher 'aes256'
set interfaces openvpn vtun10 hash 'sha512'
set interfaces openvpn vtun10 mode 'client'
set interfaces openvpn vtun10 persistent-tunnel
set interfaces openvpn vtun10 protocol 'udp'
set interfaces openvpn vtun10 remote-host '198.51.100.254'
set interfaces openvpn vtun10 remote-port '1194'
set interfaces openvpn vtun10 tls ca-certificate 'OVPN-CA'
set interfaces openvpn vtun10 tls certificate 'CLIENT'
```

### 13.5.4 Monitoring

If the client is connected successfully you can check the status

```
vyos@ovpn-server:~$ show openvpn server
OpenVPN status on vtun10
```

Client CN	Remote Host	Tunnel IP	Local Host	TX bytes	RX bytes
→ Connected	Since				

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

-----						
↔ -----						
client	198.51.100.1:55150	10.23.1.6	198.51.100.254:1194	4.7 KB	4.7 KB	↵
↔ 2023-05-11 12:47:11						

### 14.1 Prerequisites

There are different ways you can build VyOS.

Das Bauen mit einem *Docker* Container ist zwar nicht der einzige Weg, aber der einfachste, da alle Abhängigkeiten für Sie verwaltet werden. Sie können jedoch auch Ihre eigene Build-Maschine einrichten und ein *Native Build* ausführen.

---

**Bemerkung:** Starting with VyOS 1.2 the release model of VyOS has changed. VyOS is now **free as in speech, but not as in beer**. This means that while VyOS is still an open source project, the release ISOs are no longer free and can only be obtained via subscription, or by contributing to the community.

The source code remains public and an ISO can be built using the process outlined in this chapter.

The following includes the build process for VyOS 1.2 to the latest version.

---

This will guide you through the process of building a VyOS ISO using *Docker*. This process has been tested on clean installs of Debian Jessie, Stretch, and Buster.

#### 14.1.1 Native Build

To build VyOS natively you require a properly configured build host with the following Debian versions installed:

- Debian Jessie für VyOS 1.2 (Kernstück)
- Debian Buster für VyOS 1.3 (equuleus)
- Debian Bookworm for VyOS 1.4 (sagitta)
- Debian Bookworm for the upcoming VyOS 1.5/circinus/current (subject to change) - aka the rolling release

To start, clone the repository to your local machine:

```
# For VyOS 1.2 (crux)
$ git clone -b crux --single-branch https://github.com/vyos/vyos-build

# For VyOS 1.3 (equuleus)
$ git clone -b equuleus --single-branch https://github.com/vyos/vyos-build

# For VyOS 1.4 (sagitta)
$ git clone -b sagitta --single-branch https://github.com/vyos/vyos-build

# For VyOS 1.5 (circinus,current)
$ git clone -b current --single-branch https://github.com/vyos/vyos-build

$ cd vyos-build

# For VyOS 1.2 (crux) and VyOS 1.3 (equuleus)
$ ./configure --architecture amd64 --build-by "j.randomhacker@vyos.io"
$ sudo make iso

# For VyOS 1.4 (sagitta) and VyOS 1.5 (circinus,current)
$ sudo make clean
$ sudo ./build-vyos-image iso --architecture amd64 --build-by "j.randomhacker@vyos.io"
```

Die erforderlichen Pakete finden Sie in der Datei `docker/Dockerfile` im [repository](#). Das Skript `./build-vyos-image` wird Sie auch warnen, wenn irgendwelche Abhängigkeiten fehlen.

This will guide you through the process of building a VyOS ISO using Docker. This process has been tested on clean installs of Debian Bullseye (11) and Bookworm (12).

## 14.1.2 Docker

Installing [Docker](#) and prerequisites:

---

**Hinweis:** Due to the updated version of Docker, the following examples may become invalid.

---

```
# Add Docker's official GPG key:
sudo apt-get update
sudo apt-get install ca-certificates curl gnupg
sudo install -m 0755 -d /etc/apt/keyrings
curl -fsSL https://download.docker.com/linux/debian/gpg | sudo gpg --dearmor -o /etc/apt/
↳keyrings/docker.gpg
sudo chmod a+r /etc/apt/keyrings/docker.gpg

# Add the repository to Apt sources:
echo \
  "deb [arch=$(dpkg --print-architecture) signed-by=/etc/apt/keyrings/docker.gpg] https:/
↳/download.docker.com/linux/debian \
  $(. /etc/os-release && echo "$VERSION_CODENAME") stable" | \
  sudo tee /etc/apt/sources.list.d/docker.list > /dev/null

sudo apt-get update
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
sudo apt-get install docker-ce docker-ce-cli containerd.io docker-buildx-plugin docker-
↪compose-plugin
```

To be able to use [Docker](#) without sudo, the current non-root user must be added to the docker group by calling: `sudo usermod -aG docker yourusername`.

**Hinweis:** Dadurch erhält er die gleichen Rechte wie der Benutzer root! Es wird empfohlen, den Nicht-Root-Benutzer aus der docker-Gruppe zu entfernen, nachdem das VyOS-ISO erstellt wurde. Siehe auch [Docker als non-root](#).

**Bemerkung:** The build process needs to be built on a local file system, building on SMB or NFS shares will result in the container failing to build properly! VirtualBox Drive Share is also not an option as block device operations are not implemented and the drive is always mounted as „nodev“

## Container bauen

The container can be built by hand or by fetching the pre-built one from DockerHub. Using the pre-built containers from the [VyOS DockerHub organisation](#) will ensure that the container is always up-to-date. A rebuild is triggered once the container changes (please note this will take 2-3 hours after pushing to the vyos-build repository).

## Dockerhub

To manually download the container from DockerHub, run:

```
$ docker pull vyos/vyos-build:crux      # For VyOS 1.2
$ docker pull vyos/vyos-build:equuleus  # For VyOS 1.3
$ docker pull vyos/vyos-build:sagitta   # For VyOS 1.4
$ docker pull vyos/vyos-build:current   # For VyOS 1.5 rolling release
```

## Aus dem Quellcode erstellen

The container can also be built directly from source:

```
# For VyOS 1.2 (crux)
$ git clone -b crux --single-branch https://github.com/vyos/vyos-build
# For VyOS 1.3 (equuleus)
$ git clone -b equuleus --single-branch https://github.com/vyos/vyos-build
# For VyOS 1.4 (sagitta)
$ git clone -b sagitta --single-branch https://github.com/vyos/vyos-build
# For VyOS 1.5 (circinus,current)
$ git clone -b current --single-branch https://github.com/vyos/vyos-build

$ cd vyos-build
$ docker build -t vyos/vyos-build:crux docker      # For VyOS 1.2
$ docker build -t vyos/vyos-build:equuleus docker  # For VyOS 1.3
$ docker build -t vyos/vyos-build:sagitta docker   # For VyOS 1.4
$ docker build -t vyos/vyos-build:current docker   # For VyOS 1.5 rolling release
```

---

**Bemerkung:** VyOS has switched to Debian (12) Bookworm in its current branch, Due to software version updates, it is recommended to use the official Docker Hub image to build VyOS ISO.

---

## Tips and Tricks

You can create yourself some handy Bash aliases to always launch the latest - per release train (*current* or *crux*) - container. Add the following to your `.bash_aliases` file:

```
alias vybld='docker pull vyos/vyos-build:current && docker run --rm -it \
-v "$(pwd)":/vyos \
-v "$HOME/.gitconfig":/etc/gitconfig \
-v "$HOME/.bash_aliases":/home/vyos_bld/.bash_aliases \
-v "$HOME/.bashrc":/home/vyos_bld/.bashrc \
-w /vyos --privileged --sysctl net.ipv6.conf.lo.disable_ipv6=0 \
-e GOSU_UID=$(id -u) -e GOSU_GID=$(id -g) \
vyos/vyos-build:current bash'

alias vybld_crux='docker pull vyos/vyos-build:crux && docker run --rm -it \
-v "$(pwd)":/vyos \
-v "$HOME/.gitconfig":/etc/gitconfig \
-v "$HOME/.bash_aliases":/home/vyos_bld/.bash_aliases \
-v "$HOME/.bashrc":/home/vyos_bld/.bashrc \
-w /vyos --privileged --sysctl net.ipv6.conf.lo.disable_ipv6=0 \
-e GOSU_UID=$(id -u) -e GOSU_GID=$(id -g) \
vyos/vyos-build:crux bash'
```

Now you are prepared with two new aliases `vybld` and `vybld_crux` to spawn your development containers in your current working directory.

---

**Bemerkung:** Some VyOS packages (namely `vyos-1x`) come with build-time tests which verify some of the internal library calls that they work as expected. Those tests are carried out through the Python Unittest module. If you want to build the `vyos-1x` package (which is our main development package) you need to start your Docker container using the following argument: `--sysctl net.ipv6.conf.lo.disable_ipv6=0`, otherwise those tests will fail.

---

## 14.2 ISO erstellen

Now as you are aware of the prerequisites we can continue and build our own ISO from source. For this we have to fetch the latest source code from GitHub. Please note as this will differ for both *current* and *crux*.

```
# For VyOS 1.2 (crux)
$ git clone -b crux --single-branch https://github.com/vyos/vyos-build

# For VyOS 1.3 (equuleus)
$ git clone -b equuleus --single-branch https://github.com/vyos/vyos-build

# For VyOS 1.4 (sagitta)
$ git clone -b sagitta --single-branch https://github.com/vyos/vyos-build
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
# For VyOS 1.5 (circinus,current)
$ git clone -b current --single-branch https://github.com/vyos/vyos-build
```

Now a fresh build of the VyOS ISO can begin. Change directory to the vyos-build directory and run:

```
$ cd vyos-build
# For VyOS 1.2 (crux)
$ docker run --rm -it --privileged -v $(pwd):/vyos -w /vyos vyos/vyos-build:crux bash

# For VyOS 1.3 (equuleus)
$ docker run --rm -it --privileged -v $(pwd):/vyos -w /vyos vyos/vyos-build:equuleus bash

# For VyOS 1.4 (sagitta)
$ docker run --rm -it --privileged -v $(pwd):/vyos -w /vyos vyos/vyos-build:sagitta bash

# For VyOS 1.5 (current)
$ docker run --rm -it --privileged -v $(pwd):/vyos -w /vyos vyos/vyos-build:current bash
```

```
# For MacOS (crux, equuleus, sagitta)
$ git clone https://github.com/vyos/vyos-utils-misc
$ cd build-tools/macos-build

# For VyOS 1.2 (crux)
$ os=jessie64 branch=crux make build

# For VyOS 1.3 (equuleus)
$ os=buster64 branch=equuleus make build

# For VyOS 1.4 (sagitta)
$ os=buster64 branch=sagitta make build
```

Start the build:

```
# For VyOS 1.2 (crux) and VyOS 1.3 (equuleus)
vyos_bld@8153428c7e1f:/vyos$ ./configure --architecture amd64 --build-by "j.
↳ randomhacker@vyos.io"
vyos_bld@8153428c7e1f:/vyos$ sudo make iso

# For VyOS 1.4 (sagitta) For VyOS 1.5 (circinus,current)
vyos_bld@8153428c7e1f:/vyos$ sudo make clean
vyos_bld@8153428c7e1f:/vyos$ sudo ./build-vyos-image iso --architecture amd64 --build-by
↳ "j.randomhacker@vyos.io"
```

When the build is successful, the resulting iso can be found inside the build directory as live-image-[architecture].hybrid.iso.

Viel Glück!

---

**Hinweis:** Die Erstellung von VyOS auf Windows WSL2 mit Docker, das in WSL2 integriert ist, funktioniert problemlos. Bislang sind keine Probleme bekannt!

---

### 14.2.1 Anpassen

This ISO can be customized with the following list of configure options. The full and current list can be generated with `./build-vyos-image --help`:

```
$ vyos_bld@8153428c7e1f:/vyos$ sudo ./build-vyos-image --help
I: Checking if packages required for VyOS image build are installed
usage: build-vyos-image [-h] [--architecture ARCHITECTURE]
[--build-by BUILD_BY] [--debian-mirror DEBIAN_MIRROR]
[--debian-security-mirror DEBIAN_SECURITY_MIRROR]
[--pbuilder-debian-mirror PBUILDER_DEBIAN_MIRROR]
[--vyos-mirror VYOS_MIRROR] [--build-type BUILD_TYPE]
[--version VERSION] [--build-comment BUILD_COMMENT] [--debug] [--dry-run]
[--custom-apt-entry CUSTOM_APT_ENTRY] [--custom-apt-key CUSTOM_APT_KEY]
[--custom-package CUSTOM_PACKAGE]
    [build_flavor]

positional arguments:
build_flavor          Build flavor

optional arguments:
-h, --help            show this help message and exit
--architecture ARCHITECTURE
                        Image target architecture (amd64 or arm64)
--build-by BUILD_BY   Builder identifier (e.g. jrandomhacker@example.net)
--debian-mirror DEBIAN_MIRROR
                        Debian repository mirror
--debian-security-mirror DEBIAN_SECURITY_MIRROR
                        Debian security updates mirror
--pbuilder-debian-mirror PBUILDER_DEBIAN_MIRROR
                        Debian repository mirror for pbuilder env bootstrap
--vyos-mirror VYOS_MIRROR
                        VyOS package mirror
--build-type BUILD_TYPE
                        Build type, release or development
--version VERSION     Version number (release builds only)
--build-comment BUILD_COMMENT
                        Optional build comment
--debug              Enable debug output
--dry-run            Check build configuration and exit
--custom-apt-entry CUSTOM_APT_ENTRY
                        Custom APT entry
--custom-apt-key CUSTOM_APT_KEY
                        Custom APT key file
--custom-package CUSTOM_PACKAGE
                        Custom package to install from repositories
```

## ISO Build-Probleme

There are (rare) situations where building an ISO image is not possible at all due to a broken package feed in the background. APT is not very good at reporting the root cause of the issue. Your ISO build will likely fail with a more or less similar looking error message:

```
The following packages have unmet dependencies:
vyos-1x : Depends: accel-ppp but it is not installable
E: Unable to correct problems, you have held broken packages.
P: Begin unmounting filesystems...
P: Saving caches...
Reading package lists...
Building dependency tree...
Reading state information...
Del frr-pythontools 7.5-20210215-00-g8a5d3b7cd-0 [38.9 kB]
Del accel-ppp 1.12.0-95-g59f8e1b [475 kB]
Del frr 7.5-20210215-00-g8a5d3b7cd-0 [2671 kB]
Del frr-snmp 7.5-20210215-00-g8a5d3b7cd-0 [55.1 kB]
Del frr-rpki-rtrlib 7.5-20210215-00-g8a5d3b7cd-0 [37.3 kB]
make: *** [Makefile:30: iso] Error 1
(10:13) vyos_bld ece068908a5b:/vyos [current] #
```

To debug the build process and gain additional information of what could be the root cause, you need to use *chroot* to change into the build directory. This is explained in the following step by step procedure:

```
vyos_bld ece068908a5b:/vyos [current] # sudo chroot build/chroot /bin/bash
```

We now need to mount some required, volatile filesystems

```
(live)root@ece068908a5b:/# mount -t proc none /proc
(live)root@ece068908a5b:/# mount -t sysfs none /sys
(live)root@ece068908a5b:/# mount -t devtmpfs none /dev
```

We now are free to run any command we would like to use for debugging, e.g. re-installing the failed package after updating the repository.

```

(Fortsetzung der vorherigen Seite)

```

Reading package lists... Done
Building dependency tree
Reading state information... Done
Some packages could not be installed. This may mean that you have
requested an impossible situation or if you are using the unstable
distribution that some required packages have not yet been created
or been moved out of Incoming.
The following information may help to resolve the situation:

The following packages have unmet dependencies:
vyos-1x : Depends: accel-ppp but it is not installable
E: Unable to correct problems, you have held broken packages.

```

Now it's time to fix the package mirror and rerun the last step until the package installation succeeds again!

## 14.2.2 Linux Kernel

The Linux kernel used by VyOS is heavily tied to the ISO build process. The file `data/defaults.json` hosts a JSON definition of the kernel version used `kernel_version` and the `kernel_flavor` of the kernel which represents the kernel's `LOCAL_VERSION`. Both together form the kernel version variable in the system:

```

vyos@vyos:~$ uname -r
6.1.52-amd64-vyos

```

- Accel-PPP
- Intel NIC drivers
- Inter QAT

Jedes dieser Module ist von der Kernel-Version abhängig, und wenn Sie das Glück haben, einen ISO-Build-Fehler zu erhalten, der sich wie folgt anhört:

```

I: Create initramfs if it does not exist.
Extra argument '6.1.52-amd64-vyos'
Usage: update-initramfs {-c|-d|-u} [-k version] [-v] [-b directory]
Options:
  -k version    Specify kernel version or 'all'
  -c            Create a new initramfs
  -u            Update an existing initramfs
  -d            Remove an existing initramfs
  -b directory  Set alternate boot directory
  -v            Be verbose
See update-initramfs(8) for further details.
E: config/hooks/live/17-gen_initramfs.chroot failed (exit non-zero). You should check ↵
↵ for errors.

```

The most obvious reasons could be:

- `vyos-build` repo is outdated, please `git pull` to update to the latest release kernel version from us.
- You have your own custom kernel `*.deb` packages in the `packages` folder but neglected to create all required out-of tree modules like Accel-PPP, Intel QAT or Intel NIC drivers

## Den Kernel bauen

The kernel build is quite easy, most of the required steps can be found in the `vyos-build/packages/linux-kernel/Jenkinsfile` but we will walk you through it.

Klonen Sie den Kernel-Quellcode nach `vyos-build/packages/linux-kernel/`:

```
$ cd vyos-build/packages/linux-kernel/
$ git clone https://git.kernel.org/pub/scm/linux/kernel/git/stable/linux.git
```

Überprüfen Sie die benötigte Kernelversion - siehe `vyos-build/data/defaults.json` Datei (das Beispiel verwendet Kernel 4.19.146):

```
$ cd vyos-build/packages/linux-kernel/linux
$ git checkout v4.19.146
Checking out files: 100% (61536/61536), done.
Note: checking out 'v4.19.146'.
```

You are in 'detached HEAD' state. You can look around, make experimental changes and commit them, and you can discard any commits you make in this state without impacting any branches by performing another checkout.

If you want to create a new branch to retain commits you create, you may do so (now or later) by using `-b` with the checkout command again. Example:

```
git checkout -b <new-branch-name>
```

```
HEAD is now at 015e94d0e37b Linux 4.19.146
```

Now we can use the helper script `build-kernel.sh` which does all the necessary voodoo by applying required patches from the `vyos-build/packages/linux-kernel/patches` folder, copying our kernel configuration `x86_64_vyos_defconfig` to the right location, and finally building the Debian packages.

**Bemerkung:** Die Erstellung des Kernels wird einige Zeit in Anspruch nehmen, abhängig von der Geschwindigkeit und Anzahl Ihrer CPU/Kerne und der Festplattengeschwindigkeit. Rechnen Sie mit 20 Minuten (oder sogar länger) auf weniger leistungsfähiger Hardware.

```

```

In the end you will be presented with the kernel binary packages which you can then use in your custom ISO build process, by placing all the \*.deb files in the vyos-build/packages folder where they will be used automatically when building VyOS as documented above.

## Firmware

Wenn Sie Ihren Kernel aktualisieren oder neue Treiber einbinden, benötigen Sie möglicherweise eine neue Firmware. Erstellen Sie ein neues vyos-linux-firmware Paket mit den enthaltenen Hilfsskripten.

```

$ cd vyos-build/packages/linux-kernel
$ git clone https://git.kernel.org/pub/scm/linux/kernel/git/firmware/linux-firmware.git
$ ./build-linux-firmware.sh
$ cp vyos-linux-firmware_*.deb ../

```

This tries to automatically detect which blobs are needed based on which drivers were built. If it fails to find the correct files you can add them manually to vyos-build/packages/linux-kernel/build-linux-firmware.sh:

```
ADD_FW_FILES="iwlwifi* ath11k/QCA6390/*/*.bin"
```

## Erstellen von Out-Of-Tree-Modulen

Den Kernel zu bauen ist ein Teil, aber jetzt müssen Sie auch die benötigten Out-of-Tree-Module bauen, damit alles zusammenpasst und die ABIs übereinstimmen. Um dies zu tun, können Sie wieder einen Blick auf `vyos-build/packages/linux-kernel/Jenkinsfile` werfen, um alle benötigten Module und ihre ausgewählten Versionen zu sehen. Wir werden Ihnen zeigen, wie Sie alle aktuell benötigten Module bauen können.

### Accel-PPP

Klonen Sie zunächst den Quellcode und auschecken Sie die entsprechende Version aus:

```
$ cd vyos-build/packages/linux-kernel
$ git clone https://github.com/accel-ppp/accel-ppp.git
```

We again make use of a helper script and some patches to make the build work. Just run the following command:

```
$ ./build-accel-ppp.sh
I: Build Accel-PPP Debian package
CMake Deprecation Warning at CMakeLists.txt:3 (cmake_policy):
  The OLD behavior for policy CMP0003 will be removed from a future version
  of CMake.

  The cmake-policies(7) manual explains that the OLD behaviors of all
  policies are deprecated and that a policy should be set to OLD only under
  specific short-term circumstances. Projects should be ported to the NEW
  behavior and not rely on setting a policy to OLD.

-- The C compiler identification is GNU 8.3.0

...

CPack: Create package using DEB
CPack: Install projects

```

Nach dem Kompilieren der Pakete finden Sie die neu erzeugten \*.deb-Binärdateien in `vyos-build/packages/linux-kernel`, von wo aus sie in den `vyos-build/packages`-Ordner kopiert werden können, um sie während der ISO-Erstellung einzubinden.

### 14.2.3 Packages

Wenn Sie mutig genug sind, sich ein ISO-Image zu erstellen, das ein beliebiges modifiziertes Paket aus unserer GitHub-Organisation enthält, sind Sie hier genau richtig.

Jedes „modifizierte“ Paket kann sich auf eine geänderte Version von z.B. des `vyos-lx` Pakets beziehen, das Sie testen möchten, bevor Sie einen Pull Request auf GitHub stellen.

Die Erstellung eines ISO-Images mit einem angepassten Paket unterscheidet sich in keiner Weise von der Erstellung eines regulären ISO-Images (angepasst oder nicht). Legen Sie einfach Ihr modifiziertes \*.deb-Paket in den Ordner `packages` innerhalb von `vyos-build`. Der Build-Prozess wird dann Ihr angepasstes Paket aufnehmen und in Ihr ISO integrieren.

### 14.2.4 Troubleshooting

Debian APT ist nicht sehr ausführlich, wenn es um Fehler geht. Wenn Ihre ISO-Erstellung aus irgendeinem Grund fehlschlägt und Sie vermuten, dass es ein Problem mit APT-Abhängigkeiten oder der Installation ist, können Sie diesen kleinen Patch hinzufügen, der die Ausführlichkeit von APT während der ISO-Erstellung erhöht.

```

## 14.2.5 Virtualization Platforms

### QEMU

Run the following command after building the ISO image.

```
$ make qemu
```

### VMware

Run the following command after building the QEMU image.

```
$ make vmware
```

## 14.3 Packages

VyOS itself comes with a bunch of packages that are specific to our system and thus cannot be found in any Debian mirror. Those packages can be found at the [VyOS GitHub project](#) in their source format can easily be compiled into a custom Debian (\*.deb) package.

The easiest way to compile your package is with the above mentioned *Docker* container, it includes all required dependencies for all VyOS related packages.

Nehmen wir an, wir wollen das vyos-1x Paket selbst erstellen und es an unsere Bedürfnisse anpassen. Zuerst müssen wir das Repository von GitHub klonen.

```
$ git clone https://github.com/vyos/vyos-1x
```

### 14.3.1 Erstellen

Launch Docker container and build package

```
# For VyOS 1.3 (equuleus, current)
$ docker run --rm -it --privileged -v $(pwd):/vyos -w /vyos vyos/vyos-build:current bash

# Change to source directory
$ cd vyos-1x

# Build DEB
$ dpkg-buildpackage -uc -us -tc -b
```

Nach ein oder zwei Minuten finden Sie die generierten DEB-Pakete neben dem vyos-1x Quellverzeichnis:

```
# ls -al ../vyos-1x*.deb
-rw-r--r-- 1 vyos_bld vyos_bld 567420 Aug  3 12:01 ../vyos-1x_1.3dev0-1847-gb6dcb0a8_all.
↳ deb
-rw-r--r-- 1 vyos_bld vyos_bld  3808 Aug  3 12:01 ../vyos-1x-vmware_1.3dev0-1847-
↳ gb6dcb0a8_amd64.deb
```

### 14.3.2 Installieren

To take your newly created package on a test drive you can simply SCP it to a running VyOS instance and install the new \*.deb package over the current running one.

Just install using the following commands:

```
vyos@vyos:~$ dpkg --install /tmp/vyos-1x_1.3dev0-1847-gb6dcb0a8_all.deb
(Reading database ... 58209 files and directories currently installed.)
Preparing to unpack .../vyos-1x_1.3dev0-1847-gb6dcb0a8_all.deb ...
Unpacking vyos-1x (1.3dev0-1847-gb6dcb0a8) over (1.3dev0-1847-gb6dcb0a8) ...
Setting up vyos-1x (1.3dev0-1847-gb6dcb0a8) ...
Processing triggers for rsyslog (8.1901.0-1) ...
```

You can also place the generated \*.deb into your ISO build environment to include it in a custom iso, see [Linux Kernel](#) for more information.

**Warnung:** Alle Pakete im Paketverzeichnis werden während des Builds zur iso hinzugefügt und ersetzen die Upstream-Pakete. Stellen Sie sicher, dass Sie diese löschen (sowohl die Quellverzeichnisse als auch die erstellten deb-Pakete), wenn Sie eine Iso aus reinen Upstream-Paketen erstellen wollen.

Der gesamte VyOS-Quellcode wird auf GitHub unter der VyOS-Organisation gehostet, die hier zu finden ist: <https://github.com/vyos>

Our code is split into several modules. VyOS is composed of multiple individual packages, some of them are forks of upstream packages and are periodically synced with upstream, so keeping the whole source under a single repository would be very inconvenient and slow. There is now an ongoing effort to consolidate all VyOS-specific framework/config packages into vyos-1x package, but the basic structure is going to stay the same, just with fewer and fewer packages while the base code is rewritten from Perl/BASH into Python using and XML based interface definition for the CLI.

The repository that contains all the ISO build scripts is: <https://github.com/vyos/vyos-build>

The README.md file will guide you to use the this top level repository.

## 15.1 Submit a Patch

Patches are always more than welcome. To have a clean and easy to maintain repository we have some guidelines when working with Git. A clean repository eases the automatic generation of a changelog file.

Ein guter Ansatz für das Schreiben von Commit-Nachrichten ist es, einen Blick auf die Datei(en) zu werfen, indem man `git log path/to/file.txt` aufruft.

### 15.1.1 Prepare patch/commit

In a big system, such as VyOS, that is comprised of multiple components, it's impossible to keep track of all the changes and bugs/feature requests in one's head. We use a bugtracker known as [Phabricator](#) for it („issue tracker“ would be a better term, but this one stuck).

The information is used in three ways:

- Keep track of the progress (what we've already done in this branch and what we still need to do).
- Prepare release notes for upcoming releases

- Zukünftigen Betreuern von VyOS (das könnten Sie sein!) zu helfen, herauszufinden, warum bestimmte Dinge in der Codebasis geändert wurden oder warum bestimmte Funktionen hinzugefügt wurden

To make this approach work, every change must be associated with a task number (prefixed with **T**) and a component. If there is no bug report/feature request for the changes you are going to make, you have to create a [Phabricator](#) task first. Once there is an entry in [Phabricator](#), you should reference its id in your commit message, as shown below:

- `ddclient: T1030: auto create runtime directories`
- `Jenkins: add current Git commit ID to build description`

Wenn in den Commits Ihres Pull-Requests keine [Phabricator](#) Referenz vorhanden ist, müssen wir Sie bitten, die Commit-Nachricht zu ändern. Andernfalls müssen wir sie ablehnen.

## Writing good commit messages

The format should be and is inspired by: <https://git-scm.com/book/ch5-2.html> It is also worth reading <https://chris.beams.io/posts/git-commit/>

- Eine einzelne, kurze Zusammenfassung des Commits (empfohlen 50 Zeichen oder weniger, nicht mehr als 80 Zeichen), die ein Präfix der geänderten Komponente und die entsprechende [Phabricator](#) Referenz enthält, z.B. `snmp: T1111:` oder `Ethernet: T2222:` - mehrere Komponenten können verkettet werden, wie z.B. `snmp: ethernet: T3333`
- In some contexts, the first line is treated as the subject of an email and the rest of the text as the body. The blank line separating the summary from the body is critical (unless you omit the body entirely); tools like rebase can get confused if you run the two together.
- Es folgt eine Meldung, in der alle Einzelheiten beschrieben werden, wie z. B:
  - What/why/how something has been changed, makes everyone's life easier when working with *git bisect*
  - Der gesamte Text der Commit-Nachricht sollte, wenn möglich 72 Zeichen pro Zeile haben, was das Lesen von Commit-Protokollen mit `git log` auf einem Standard-Terminal (das 80x25 ist) erleichtert.
  - Falls zutreffend, sollte ein Verweis auf einen vorhergehenden Commit gemacht werden, der diese Commits beim Durchsuchen der History gut miteinander verbindet: Nach dem Commit `abcd12ef` ("`snmp: this is a headline`") fehlt eine Python-Import-Anweisung, die folgende Ausnahme auslöst: `ABCDEF`
- Verwenden Sie immer die Option `-x` für den Befehl `git cherry-pick`, wenn Sie einen einzelnen Commit portieren. Dadurch wird automatisch die Zeile: `(cherry picked from commit <ID>)` an die ursprüngliche Commit-Nachricht des Autors angehängt, was es einfacher macht, Probleme zu finden.
- Jeder Änderungssatz muss konsistent (in sich geschlossen) sein! Beheben Sie nicht mehrere Fehler in einem einzigen Commit. Wenn Sie bereits an mehreren Fehlerkorrekturen in derselben Datei gearbeitet haben, verwenden Sie `git add -patch`, um nur die Teile, die sich auf das eine Problem beziehen, in Ihren nächsten Commit aufzunehmen.

Limits:

- We only accept bugfixes in packages other than <https://github.com/vyos/vyos-1x> as no new functionality should use the old style templates (node.def and Perl/BASH code. Use the new style XML/Python interface instead.

Please submit your patches using the well-known GitHub pull-request against our repositories found in the VyOS GitHub organisation at <https://github.com/vyos>

### 15.1.2 Bestimmen Sie das Quellpaket

Suppose you want to make a change in the webproxy script but yet you do not know which of the many VyOS packages ship this file. You can determine the VyOS package name in question by using Debian's `dpkg -S` command of your running VyOS installation.

```
vyos@vyos:~$ dpkg -S /opt/vyatta/sbin/vyatta-update-webproxy.pl
vyatta-webproxy: /opt/vyatta/sbin/vyatta-update-webproxy.pl
```

This means the file in question (`/opt/vyatta/sbin/vyatta-update-webproxy.pl`) is located in the `vyatta-webproxy` package which can be found here: <https://github.com/vyos/vyatta-webproxy>

### 15.1.3 Repository forken und Patch einreichen

Das Forken des Repositories und das Einreichen eines GitHub Pull-Requests ist der bevorzugte Weg, um Ihre Änderungen an VyOS zu übermitteln. Sie können jedes VyOS-Repository zu Ihrem eigenen GitHub-Account forken, indem Sie einfach `/fork` an die URL eines beliebigen Repositories auf GitHub anhängen. Um z.B. das `vyos-1x` Repository zu forken, öffnen Sie die folgende URL in Ihrem Lieblingsbrowser: <https://github.com/vyos/vyos-1x/fork>

You then can proceed with cloning your fork or add a new remote to your local repository:

- Klonen: `git clone https://github.com/<user>/vyos-1x.git`
- Fork: `git remote add myfork https://github.com/<user>/vyos-1x.git`

In order to record you as the author of the fix please identify yourself to Git by setting up your name and email. This can be done local for this one and only repository `git config` or globally using `git config --global`.

```
git config --global user.name "J. Random Hacker"
git config --global user.email "jrhacker@example.net"
```

Make your changes and save them. Do the following for all changes files to record them in your created Git commit:

- Hinzufügen einer Datei zum Git-Index mit `git add myfile`, oder für ein ganzes Verzeichnis: `git add somedir/*`
- Übertragen Sie die Änderungen durch den Aufruf von `git commit`. Bitte verwenden Sie eine aussagekräftige Commit-Überschrift (siehe oben) und vergessen Sie nicht, die [Phabricator](#) ID anzugeben.
- Submit the patch `git push` and create the GitHub pull-request.

### 15.1.4 Patch an Phabricator-Aufgabe anhängen

Folgen Sie den obigen Schritten zu „Fork repository to submit a Patch“. Anstatt Ihre Änderungen auf GitHub hochzuladen, können Sie die Patches/Commits exportieren und an [maintainers@vyos.net](mailto:maintainers@vyos.net) senden oder direkt an den Bug anhängen (bevorzugte Variante)

- Exportieren Sie den letzten Commit in eine Patch-Datei: `git format-patch` oder exportiere die letzten beiden Commits in die entsprechenden Patch-Dateien: `git format-patch -2`

## 15.2 Programmierrichtlinien

Like any other project we have some small guidelines about our source code, too. The rules we have are not there to punish you - the rules are in place to help us all. By having a consistent coding style it becomes very easy for new and also longtime contributors to navigate through the sources and all the implied logic of any one source file..

Python 3 **shall** be used. How long can we keep Python 2 alive anyway? No considerations for Python 2 compatibility **should** be taken at any time.

### 15.2.1 Formatierung

- Python: Tabs **shall not** be used. Every indentation level should be 4 spaces
- XML: Tabs **shall not** be used. Every indentation level should be 2 spaces

---

**Bemerkung:** There are extensions to e.g. VIM (xmllint) which will help you to get your indention levels correct. Add to following to your .vimrc file: `au FileType xml setlocal equalprg=xmllint\ --format\ --recover\ -\ 2>/dev/null` now you can call the linter using `gg=G` in command mode.

---

#### Text generation

Template processor **should** be used for generating config files. Built-in string formatting **may** be used for simple line-oriented formats where every line is self-contained, such as iptables rules. Template processor **must** be used for structured, multi-line formats such as those used by ISC DHCPd.

The default template processor for VyOS code is [Jinja2](#).

### 15.2.2 Summary

When modifying the source code, remember these rules of the legacy elimination campaign:

- No new features in Perl
- No old style command definitions
- No code incompatible with Python3

## 15.3 Python

The switch to the Python programming language for new code is not merely a change of the language, but a chance to rethink and improve the programming approach.

Let's face it: VyOS is full of spaghetti code where logic for reading the VyOS config, generating daemon configs, and restarting processes is all mixed up.

Python (or any other language, for that matter) does not provide automatic protection from bad design, so we need to also devise design guidelines and follow them to keep the system extensible and maintainable.

Aber wir sind hier, um Sie zu unterstützen und Ihnen zu zeigen, wie Sie ein guter VyOS Mitwirkender werden können. Unsere Regeln sind nicht dazu da, Sie zu bestrafen - die Regeln sind dazu da, uns allen zu helfen. Was bedeutet das? Durch einen einheitlichen Programmierstil wird es sowohl für neue als auch für langjährige Mitwirkende sehr einfach, sich in den Quellen und der ganzen Logik des Spaghetti-Codes zurechtzufinden.

Please use the following template as good starting point when developing new modules or even rewrite a whole bunch of code in the new style XML/Python interface.

### 15.3.1 Struktur und Verhalten des Konfigurationsskripts

Your configuration script or operation mode script which is also written in Python3 should have a line break on 80 characters. This seems to be a bit odd nowadays but as some people also work remotely or program using vi(m) this is a fair good standard which I hope we can rely on.

Darüber hinaus hilft dies auch beim Durchsuchen der GitHub-Codebasis auf einem mobilen Gerät, wenn Sie ein verrückter Wissenschaftler sind.

```
#!/usr/bin/env python3

import sys

from vyos.config import Config
from vyos import ConfigError

def get_config():
    if config:
        conf = config
    else:
        conf = Config()

    # Base path to CLI nodes
    base = ['...', '...']
    # Convert the VyOS config to an abstract internal representation
    config_data = conf.get_config_dict(base, key_mangling('-', '_'), get_first_key=True)
    return config_data

def verify(config):
    # Verify that configuration is valid
    if invalid:
        raise ConfigError("Descriptive message")
    return True

def generate(config):
    # Generate daemon configs
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

pass

def apply(config):
    # Apply the generated configs to the live system
    pass

try:
    c = get_config()
    verify(c)
    generate(c)
    apply(c)
except ConfigError as e:
    print(e)
    sys.exit(1)

```

The `get_config()` function must convert the VyOS config to an abstract, internal representation. No other function is allowed to call the `vyos.config.Config` object method directly. The rationale for it is that when config reads are mixed with other logic, it's very hard to change the config syntax since you need to weed out every occurrence of the old syntax. If syntax-specific code is confined to a single function, the rest of the code can be left untouched as long as the internal representation remains compatible.

Ein weiterer Vorteil ist die Testbarkeit des Codes. Das Mocking des gesamten Konfigurations-Subsystems ist schwierig, während die Konstruktion einer internen Darstellung von Hand viel einfacher ist.

The `verify()` function takes your internal representation of the config and checks if it's valid, otherwise it must raise `ConfigError` with an error message that describes the problem and possibly suggests how to fix it. It must not make any changes to the system. The rationale for it is again testability and, in the future when the config backend is ready and every script is rewritten in this fashion, ability to execute commit dry run („commit test“ like in JunOS) and abort commit before making any changes to the system if an error is found in any component.

The `generate()` function generates config files for system components.

The `apply()` function applies the generated configuration to the live system. It should use non-disruptive reload whenever possible. It may execute disruptive operations such as daemon process restart if a particular component does not support non-disruptive reload, or when the expected service degradation is minimal (for example, in case of auxiliary services such as LLDPd). In case of high impact services such as VPN daemon and routing protocols, when non-disruptive reload is supported for some but not all types of configuration changes, scripts authors should make effort to determine if a configuration change can be done in a non-disruptive way and only resort to disruptive restart if it cannot be avoided.

Unless absolutely necessary, configuration scripts should not modify the active configuration of system components directly. Whenever at all possible, scripts should generate a configuration file or files that can be applied with a single command such as reloading a service through `systemd init`. Inserting statements one by one is particularly discouraged, for example, when configuring netfilter rules, saving them to a file and loading it with `iptables-restore` should always be preferred to executing `iptables` directly.

The `apply()` and `generate()` functions may raise `ConfigError` if, for example, the daemon failed to start with the updated config. It shouldn't be a substitute for proper config checking in the `verify()` function. All reasonable effort should be made to verify that generated configuration is valid and will be accepted by the daemon, including, when necessary, cross-checks with other VyOS configuration subtrees.

Ausnahmen, einschließlich `VyOSError` (der von `vyos.config.Config` bei unsachgemäßen Konfigurationsoperationen ausgelöst wird, wie z.B. der Versuch, `list_nodes()` auf einem Nicht-Tag-Knoten zu verwenden), sollten nicht unterdrückt oder abgefangen und als Konfigurationsfehler erneut ausgelöst werden. Sicherlich wird dies auf dem Bildschirm des Benutzers nicht schön aussehen, aber es wird viel bessere Fehlerberichte erstellen und den Benutzern (und die meisten VyOS-Benutzer sind IT-Profis) helfen, ihre eigene Fehlersuche zu betreiben.

Zum leichteren Verständnis empfehlen wir Ihnen einen Blick auf die Implementierung von `ntp.py` oder `interfaces-bonding.py` (für Tag-Knoten) zu werfen. Beide Dateien sind im `vyos-1x` Repository zu finden.

## 15.4 XML (used for CLI definitions)

The bash (or better vbash) completion in VyOS is defined in *templates*. Templates are text files (called `node.def`) stored in a directory tree. The directory names define the command names, and template files define the command behaviour. Before VyOS 1.2 (crux) this files were created by hand. After a complex redesign [process](#) the new style template are automatically generated from a XML input file.

XML interface definitions for VyOS come with a RelaxNG schema and are located in the `vyos-1x` module. This schema is a slightly modified schema from `VyConf` alias VyOS 2.0 So VyOS 1.2.x interface definitions will be reusable in Nextgen VyOS Versions with very minimal changes.

The great thing about schemas is not only that people can know the complete grammar for certain, but also that it can be automatically verified. The `scripts/build-command-templates` script that converts the XML definitions to old style templates also verifies them against the schema, so a bad definition will cause the package build to fail. I do agree that the format is verbose, but there is no other format now that would allow this. Besides, a specialized XML editor can alleviate the issue with verbosity.

Example:

```
<?xml version="1.0"?>
<!-- Cron configuration -->
<interfaceDefinition>
  <node name="system">
    <children>
      <node name="task-scheduler">
        <properties>
          <help>Task scheduler settings</help>
        </properties>
        <children>
          <tagNode name="task" owner="{vyos_conf_scripts_dir}/task_scheduler.py">
            <properties>
              <help>Scheduled task</help>
              <valueHelp>
                <format>&lt;string&gt;</format>
                <description>Task name</description>
              </valueHelp>
              <priority>999</priority>
            </properties>
            <children>
              <leafNode name="crontab-spec">
                <properties>
                  <help>UNIX crontab time specification string</help>
                </properties>
              </leafNode>
              <leafNode name="interval">
                <properties>
                  <help>Execution interval</help>
                  <valueHelp>
                    <format>&lt;minutes&gt;</format>
                    <description>Execution interval in minutes</description>
                  </valueHelp>

```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```

        </valueHelp>
        <valueHelp>
            <format>&lt;minutes&gt;m</format>
            <description>Execution interval in minutes</description>
        </valueHelp>
        <valueHelp>
            <format>&lt;hours&gt;h</format>
            <description>Execution interval in hours</description>
        </valueHelp>
        <valueHelp>
            <format>&lt;days&gt;d</format>
            <description>Execution interval in days</description>
        </valueHelp>
        <constraint>
            <regex>[1-9]([0-9]*)([mhd]{0,1})</regex>
        </constraint>
    </properties>
</leafNode>
<node name="executable">
    <properties>
        <help>Executable path and arguments</help>
    </properties>
    <children>
        <leafNode name="path">
            <properties>
                <help>Path to executable</help>
            </properties>
        </leafNode>
        <leafNode name="arguments">
            <properties>
                <help>Arguments passed to the executable</help>
            </properties>
        </leafNode>
    </children>
</node>
</children>
</tagNode>
</children>
</node>
</children>
</node>
</interfaceDefinition>

```

Befehlsdefinitionen sind rein deklarativ und können keine Logik enthalten. Die gesamte Logik zur Erzeugung von Konfigurationsdateien für Ziellanwendungen, zum Neustart von Diensten usw. wird stattdessen in Konfigurationsskripten implementiert.

### 15.4.1 GNU Preprocessor

XML interface definition files use the *xml.in* file extension which was implemented in T1843. XML interface definitions tend to have a lot of duplicated code in areas such as:

- VIF (incl. VIF-S/VIF-C)
- Adresse
- Beschreibung
- Aktiviert/Deaktiviert

Instead of supplying all those XML nodes multiple times there are now include files with predefined features. Brief overview:

- IPv4, IPv6 and DHCP(v6) address assignment
- IPv4, IPv6 address assignment
- VLAN (VIF) definition
- MAC address assignment

Alle XML-Eingabedateien für Schnittstellendefinitionen (.in-Suffix) werden an den GCC-Vorprozess gesendet und die Ausgabe wird im Ordner *build/interface-definitions* gespeichert. Das zuvor erwähnte *scripts/build-command-templates*-Skript arbeitet im Ordner *build/interface-definitions*, um alle erforderlichen CLI-Knoten zu generieren.

```
$ make interface_definitions
install -d -m 0755 build/interface-definitions
install -d -m 0755 build/op-mode-definitions
Generating build/interface-definitions/intel_qat.xml from interface-definitions/intel_
↳ qat.xml.in
Generating build/interface-definitions/interfaces-bonding.xml from interface-definitions/
↳ interfaces-bonding.xml.in
Generating build/interface-definitions/cron.xml from interface-definitions/cron.xml.in
Generating build/interface-definitions/pppoe-server.xml from interface-definitions/pppoe-
↳ server.xml.in
Generating build/interface-definitions/mdns-repeater.xml from interface-definitions/mdns-
↳ repeater.xml.in
Generating build/interface-definitions/tftp-server.xml from interface-definitions/tftp-
↳ server.xml.in
[...]
```

### 15.4.2 Leitlinien

#### Use of numbers

Use of numbers in command names **should** be avoided unless a number is a part of a protocol name or similar. Thus, protocols `ospfv3` is perfectly fine, but something like `server-1` is questionable at best.

## Hilfetext

To ensure uniform look and feel, and improve readability, we should follow a set of guidelines consistently.

## Großschreibung und Zeichensetzung

The first word of every help string **must** be capitalized. There **must not** be a period at the end of help strings.

Rationale: this seems to be the unwritten standard in network device CLIs, and a good aesthetic compromise.

Beispiele:

- Gut: „Frobnication algorithm“
- Schlecht: „frobnication algorithm“
- Schlecht: „Frobnication algorithm.“
- Schrecklich: „frobnication algorithm.“

## Use of abbreviations and acronyms

Abkürzungen und Akronyme **müssen** groß geschrieben werden.

Beispiele:

- Gut: „TCP connection timeout“
- Schlecht: „tcp connection timeout“
- Schrecklich: „Tcp connection timeout“

Auch Akronyme **müssen** groß geschrieben werden, um sie optisch von normalen Wörtern zu unterscheiden:

Beispiele:

- Gut: RADIUS (as in remote authentication for dial-in user services)
- Schlecht: radius (unless it's about the distance between a center of a circle and any of its points)

Some abbreviations are traditionally written in mixed case. Generally, if it contains words „over“ or „version“, the letter **should** be lowercase. If there's an accepted spelling (especially if defined by an RFC or another standard), it **must** be followed.

Beispiele:

- Gut: PPPoE, IPsec
- Schlecht: PPPOE, IPSEC
- Schlecht: pppoe, ipsec

## Use of verbs

Verbs **should** be avoided. If a verb can be omitted, omit it.

Beispiele:

- Gut: „TCP connection timeout“
- Schlecht: „Set TCP connection timeout“

Wenn ein Verb wesentlich ist, behalten Sie es bei. Zum Beispiel ist im Hilfetext von `set system ipv6 disable-forwarding` die Formulierung „Disable IPv6 forwarding on all interfaces“ vollkommen gerechtfertigt.

## Prefer infinitives

Verbs, when they are necessary, **should** be in their infinitive form.

Beispiele:

- Gut: „Disable IPv6 forwarding“
- Schlecht: „Disables IPv6 forwarding“

### 15.4.3 Migrating old CLI

Old concept/syntax	New syntax	Notes
mynode/node.def	<node name="mynode"> </node>	Leaf nodes (nodes with values) use <leafNode> tag instead
mynode/node.tag , tag:	<tagNode name="mynode"> </node>	
help: My node	<properties> <help>My node</help>	
val_help: <format>; some string	<properties> <value-Help> <format> format </format> <description> some string </description>	Fügen Sie keine spitzen Klammern um das Format hinzu, sie werden automatisch eingefügt.
syntax:expression: pattern	<properties> <constraint> <regex> ...	<constraintErrorMessage> wird im Fehlerfall angezeigt
syntax:expression: \$VAR(@) in „foo“, „bar“, „baz“	None	Use regex
syntax:expression: exec ...	<properties> <constraint> <validator> <name =“foo“ argument=“bar“>	„\${vyos_libexecdir}/validators/foo bar \$VAR(@)“ wird ausgeführt, <constraintErrorMessage> wird bei Fehler angezeigt
syntax:expression: (arithmetic expression)	None	External arithmetic validator may be added if there's demand, complex validation is better left to commit-time scripts
priority: 999	<properties> <priority>999</priority>	Please leave a comment explaining why the priority was chosen (e.g. „after interfaces are configured“)
multi:	<properties> <multi/>	Only applicable to leaf nodes
allowed: echo foo bar	<properties> <completionHelp> <list> foo bar </list>	
allowed: cli-shell-api listNodes vpn ipsec esp-group	<properties> <completionHelp> <path> vpn ipsec esp-group </path> ...	
allowed: /path/to/script	<properties> <completionHelp> <script> /path/to/script </script> ...	
default:	None	Move default values to scripts
commit:expression:	None	Alle tests während des Commits sollten in der Funktion verify() des Skripts enthalten sein
begin:/create:/delete:	None	Die gesamte Logik sollte in den Skripten enthalten sein

## 15.5 C++ Backend-Code

The CLI parser used in VyOS is a mix of bash, bash-completion helper and the C++ backend library [vyatta-cfg](<https://github.com/vyos/vyatta-cfg>). This section is a reference of common CLI commands and the respective entry point in the C/C++ code.

- `set`
  - <https://github.com/vyos/vyatta-cfg/blob/0f42786a0b3/src/cstore/cstore.cpp#L352>
  - <https://github.com/vyos/vyatta-cfg/blob/0f42786a0b3/src/cstore/cstore.cpp#L2549>
- `commit`
  - <https://github.com/vyos/vyatta-cfg/blob/0f42786a0b3/src/commit/commit-algorithm.cpp#L1252>

## 15.6 Continuous Integration

VyOS makes use of [Jenkins](#) as our Continuous Integration (CI) service. Our [VyOS CI](#) server is publicly accessible here: <https://ci.vyos.net>. You can get a brief overview of all required components shipped in a VyOS ISO.

To build our modules we utilize a CI/CD Pipeline script. Each and every VyOS component comes with it's own `Jenkinsfile` which is (more or less) a copy. The Pipeline utilizes the Docker container from the *ISO erstellen* section - but instead of building it from source on every run, we rather always fetch a fresh copy (if needed) from [Dockerhub](#).

Jedes Modul wird bei Bedarf gebaut, wenn ein neuer Commit für den betreffenden Zweig gefunden wird. Nach einem erfolgreichen Lauf werden die resultierenden Debian-Pakete in unserem Debian-Repository bereitgestellt, das während der Build-Zeit verwendet wird. Es befindet sich hier: <http://dev.packages.vyos.net/repositories/>.

### 16.1 Fehlerbericht/Ereignis

Issues or bugs are found in any software project. VyOS is not an exception.

Alle Probleme sollten den Entwicklern gemeldet werden. So können die Entwickler erfahren, was nicht richtig funktioniert. Ohne diese Art von Feedback wird jeder Entwickler glauben, dass alles richtig funktioniert.

#### 16.1.1 Ich habe einen Fehler gefunden, was soll ich tun?

When you believe you have found a bug, it is always a good idea to verify the issue prior to opening a bug request.

- Ziehen Sie die [documentation](#) zu Rate, um sicherzustellen, dass Sie Ihr System richtig konfiguriert haben.
- Holen Sie sich Unterstützung aus der Community über [Slack](#) oder unser [Forum](#).

#### 16.1.2 Sicherstellen, dass das Problem reproduzierbar ist

You should include the following information:

- A sequence of configuration commands or a complete configuration file required to recreate a setup where the bug occurs. Please avoid partial configs: a sequence of commands is easy to paste into the console, a complete config is easy to load in a VM, but a partial config is neither! At least not until we implement a „merge from the CLI“ feature that allows pasting config file chunks into a session.
- The behavior you expect and how it's different from the behavior you observe. Don't just include command outputs or traffic dumps — try to explain at least briefly why they are wrong and what they should be.
- A sequence of actions that triggers the bug. We understand that it's not always possible, but it makes developer's job a lot easier and also allows any community member to independently confirm that the bug still exists or if it's already fixed.

- If it's a regression, tell us a VyOS version where the feature still worked correctly. It's perfect if you can tell exactly which version broke it, but we understand that it's not always easy or feasible — any working version is acceptable.

If you aren't certain what the correct behavior is and if what you see is really a bug, or if you don't have a reproducing procedure that reliably triggers it, please create a post on the forum or ask in the chat first — or, if you have a subscription, create a support ticket. Our team and community members can help you identify the bug and work around it, then create an actionable and testable bug report.

### 16.1.3 Report a Bug

In order to open up a bug-report/feature request you need to create yourself an account on VyOS [Phabricator](#). On the left side of the specific project (VyOS 1.2 or VyOS 1.3) you will find quick-links for opening a bug-report/feature request.

- Provide as much information as you can
- Which version of VyOS are you using? `run show version`
- Wie können wir diesen Fehler reproduzieren?

## 16.2 Feature Requests

You have an idea of how to make VyOS better or you are in need of a specific feature which all users of VyOS would benefit from? To send a feature request please search [Phabricator](#) to check if there is already a request pending. You can enhance it or if you don't find one, create a new one by use the quick link in the left side under the specific project.

You must create a task before you start working on a feature. Yes, even if it's a tiny feature — we use the task tracker to generate release notes, so it's essential that everything is reflected there.

You must include at least the following:

- A reasonably detailed description of the feature: what it is, how it's supposed to work, and how you'd use it. The maintainers aren't familiar with every feature of every protocol and tool, and community contributors who are looking for tasks to work on will also appreciate more information that helps them implement and test a feature.
- Proposed CLI syntax, if the feature requires new commands. Please include both configuration and operational mode commands, if both are required.

You should include the following information:

- Is the feature supported by the underlying component (FreeRangeRouting, nftables, Kea...) already?
- How you'd configure it by hand there?
- Are there any limitations (hardware support, resource usage)?
- Are there any adverse or non-obvious interactions with other features? Should it be mutually exclusive with anything?

It's fine if you cannot provide some of that information, but if you can, it makes the work of developers considerably simpler, so try to do the research to answer those questions.

## 16.3 Task auto-closing

There is a special status for tasks where all work on the side of maintainers and contributors is complete: „Needs reporter action“.

We assign that status to:

- Feature requests that do not include required information and need clarification.
- Bug reports that lack reproducing procedures.
- Tasks that are implemented and tested by the implementation author, but require testing in the real-world environment that only the reporter can replicate (e.g., hardware we do not have, specific network conditions...).

This is what will happen when a task is set to „Needs reporter action“:

- If there is no response from the reporter within two weeks, the task bot will add a comment („Any news?“) to remind the reporter to reply.
- If there is no response after further two weeks, the task will be automatically closed.

We will not auto-close tasks with any other status and will not close tasks for the lack of maintainer activity!

---

## Upstream packages

---

Many base system packages are pulled straight from Debian’s main and contrib repositories, but there are exceptions. This chapter lists those exceptions and gives you a brief overview what we have done on those packages. If you only want to build yourself a fresh ISO you can completely skip this chapter. It may become interesting once you have a VyOS deep dive.

### 17.1 vyos-netplug

Aufgrund von Problemen in der Upstream-Version, die manchmal zum Ausfall von Schnittstellen führten, wird eine modifizierte Version verwendet.

The source is located at <https://github.com/vyos/vyos-netplug>

In the future, we may switch to using systemd infrastructure instead. Building it doesn’t require a special procedure.

### 17.2 keepalived

Keepalived normally isn’t updated to newer feature releases between Debian versions, so we are building it from source.

Debian behält sein Paket in Git, aber es ist ein Upstream-Tarball, der ohne seine ursprüngliche Commit-Historie in Git importiert wird. Um in der Lage zu sein, neue Tags einzubinden, führen wir einen Fork des Upstream-Repositorys mit den von Debian importierten Paketdateien unter <https://github.com/vyos/keepalived-upstream>.

## 17.3 strongswan

Our StrongSWAN build differs from the upstream:

- strongswan-nm package build is disabled since we don't use NetworkManager
- Patches for DMVPN are merged in

The source is at <https://github.com/vyos/vyos-strongswan>

DMVPN-Patches werden durch diesen Commit hinzugefügt: <https://github.com/vyos/vyos-strongswan/commit/1cf12b0f2f921bfc51affa3b81226>

Our op mode scripts use the python-vici module, which is not included in Debian's build, and isn't quite easy to integrate in that build. For this reason we debianize that module by hand now, using this procedure:

0. Install <https://pypi.org/project/stdeb/>
1. `cd vyos-strongswan`
2. `./configure --enable-python-eggs`
3. `cd src/libcharon/plugins/vici/python`
4. `make`
5. `python3 setup.py --command-packages=stdeb.command bdist_deb`

The package ends up in `deb_dist` dir.

## 17.4 mdns-repeater

This package doesn't exist in Debian. A debianized fork is kept at <https://github.com/vyos/mdns-repeater>

No special build procedure is required.

## 17.5 udp-broadcast-relay

This package doesn't exist in Debian. A debianized fork is kept at <https://github.com/vyos/udp-broadcast-relay>

No special build procedure is required.

## 17.6 hvinfo

Ein Fork mit Paketierungsänderungen für VyOS wird unter <https://github.com/vyos/hvinfo> geführt.

The original repo is at <https://github.com/dmbaturin/hvinfo>

It's an Ada program and requires GNAT and gprbuild for building, dependencies are properly specified so just follow debuild's suggestions.

There are two flags available to aid in debugging configuration scripts. Since configuration loading issues will manifest during boot, the flags are passed as kernel boot parameters.

## 18.1 ISO-Image erstellen

When having trouble compiling your own ISO image or debugging Jenkins issues you can follow the steps at *ISO Build-Probleme*.

## 18.2 System Startup

The system startup can be debugged (like loading in the configuration file from `/config/config.boot`). This can be achieved by extending the Kernel command-line in the bootloader.

### 18.2.1 Kernel

- **vyos-debug** - Adding the parameter to the linux boot line will produce timing results for the execution of scripts during commit. If one is seeing an unexpected delay during manual or boot commit, this may be useful in identifying bottlenecks. The internal flag is `VYOS_DEBUG`, and is found in `vyatta-cfg`. Output is directed to `/var/log/vyatta/cfg-stdout.log`.
- **vyos-config-debug** - During development, coding errors can lead to a commit failure on boot, possibly resulting in a failed initialization of the CLI. In this circumstance, the kernel boot parameter `vyos-config-debug` will ensure access to the system as user `vyos`, and will log a Python stack trace to the file `/tmp/boot-config-trace`. File `boot-config-trace` will generate only if config loaded with a failure status.

## 18.3 Live System

Eine Reihe von Flags kann eingerichtet werden, um das Verhalten von VyOS zur Laufzeit zu ändern. Diese Flags können entweder durch Umgebungsvariablen oder durch das Erstellen von Dateien umgeschaltet werden.

Für jedes Feature kann eine Datei namens `vyos.feature.debug` erstellt werden, um das Feature einzuschalten. Wenn ein Parameter erforderlich ist, kann dieser in der ersten Zeile der Datei angegeben werden.

The file can be placed in `/tmp` for one time debugging (as the file will be removed on reboot) or placed in `/config` to stay permanently.

Zum Beispiel kann `/tmp/vyos.ifconfig.debug` erstellt werden, um das Debuggen von Schnittstellen zu ermöglichen.

It is also possible to set up the debugging using environment variables. In that case, the name will be (in uppercase) `VYOS_FEATURE_DEBUG`.

Wenn Sie zum Beispiel `export VYOS_IFCONFIG_DEBUG=""` in Ihrer `vbash` ausführen, hat das den gleichen Effekt wie `touch /tmp/vyos.ifconfig.debug`.

- `ifconfig` - Once set, all commands used, and their responses received from the OS, will be presented on the screen for inspection.
- `command` - Once set, all commands used, and their responses received from the OS, will be presented on the screen for inspection.
- `developer` - Should a command fail, instead of printing a message to the user explaining how to report issues, the python interpreter will start a PBD post-mortem session to allow the developer to debug the issue. As the debugger will wait for input from the developer, it has the capacity to prevent a router to boot and therefore should only be permanently set up on production if you are ready to see the OS fail to boot.
- `log` - In some rare cases, it may be useful to see what the OS is doing, including during boot. This option sends all commands used by VyOS to a file. The default file is `/tmp/full-log` but it can be changed.

---

**Bemerkung:** In order to retrieve the debug output on the command-line you need to disable `vyos-configd` in addition. This can be run either one-time by calling `sudo systemctl stop vyos-configd` or make this reboot-safe by calling `sudo systemctl disable vyos-configd`.

---

### 18.3.1 FRR

Recent versions use the `vyos.frr` framework. The Python class is located inside our `vyos-1x:python/vyos/frr.py`. It comes with an embedded debugging/ (print style) debugger as `vyos.ifconfig` does.

To enable debugging just run: `$ touch /tmp/vyos.frr.debug`

### 18.3.2 Fehlersuche im Python-Code mit PDB

Sometimes it might be useful to debug Python code interactively on the live system rather than a IDE. This can be achieved using `pdb`.

Let us assume you want to debug a Python script that is called by an op-mode command. After you found the script by looking up the op-mode-definitions you can edit the script in the live system using e.g. `vi /usr/libexec/vyos/op_mode/show_xyz.py`

Insert the following statement right before the section where you want to investigate a problem (e.g. a statement you see in a backtrace): `import pdb; pdb.set_trace()` Optionally you can surrounded this statement by an `if` which only triggers under the condition you are interested in.

Once you run `show xyz` and your condition is triggered you should be dropped into the python debugger:

```
> /usr/libexec/vyos/op_mode/show_nat_translations.py(109)process()
-> rule_type = rule.get('type', '')
(Pdb)
```

You can type `help` to get an overview of the available commands, and `help command` to get more information on each command.

Useful commands are:

- examine variables using `pp(var)`
- continue execution using `cont`
- get a backtrace using `bt`

### 18.3.3 Skripte für die Konfigurationsmigration

When writing a new configuration migrator it may happen that you see an error when you try to invoke it manually on a development system. This error will look like:

```
vyos@vyos:~$ /opt/vyatta/etc/config-migrate/migrate/ssh/0-to-1 /tmp/config.boot
Traceback (most recent call last):
  File "/opt/vyatta/etc/config-migrate/migrate/ssh/0-to-1", line 31, in <module>
    config = ConfigTree(config_file)
  File "/usr/lib/python3/dist-packages/vyos/configtree.py", line 134, in __init__
    raise ValueError("Failed to parse config: {0}".format(msg))
ValueError: Failed to parse config: Syntax error on line 240, character 1: Invalid_
↪syntax.
```

The reason is that the configuration migration backend is rewritten and uses a new form of „magic string“ which is applied on demand when real config migration is run on boot. When running individual migrators for testing, you need to convert the „magic string“ on your own by:

```
vyos@vyos:~$ /usr/libexec/vyos/run-config-migration.py --virtual --set-vintage vyos /tmp/
↪config.boot
```

### 18.3.4 Konfigurationsfehler beim Systemstart

Being brave and running the latest rolling releases will sometimes trigger bugs due to corner cases we missed in our design. Those bugs should be filed via [Phabricator](#) but you can help us to narrow down the issue. Login to your VyOS system and change into configuration mode by typing `configure`. Now re-load your boot configuration by simply typing `load` followed by `return`.

You should now see a Python backtrace which will help us to handle the issue, please attach it to the [Phabricator](#) task.

### 18.3.5 Startzeitpunkt

Während der Migration und des umfangreichen Umschreibens von Funktionalität von Perl nach Python wurde eine deutliche Erhöhung der gesamten Systemstartzeit festgestellt. Die Systemstartzeit kann analysiert werden, und am Ende kann ein Diagramm erstellt werden, das im Detail zeigt, wer wen während der Systemstartphase aufgerufen hat.

This is done by utilizing the `systemd-bootchart` package which is now installed by default on the VyOS 1.3 (equuleus) branch. The configuration is also versioned so we get comparable results. `systemd-bootchart` is configured using this file: [bootchart.conf](#)

To enable boot time graphing change the Kernel commandline and add the following string: `init=/usr/lib/systemd/systemd-bootchart`

This can also be done permanently by changing `/boot/grub/grub.cfg`.

## 18.4 Priorities

VyOS CLI is all about priorities. Every CLI node has a corresponding `node.def` file and possibly an attached script that is executed when the node is present. Nodes can have a priority, and on system bootup - or any other `commit` to the config all scripts are executed from lowest to highest priority. This is good as this gives a deterministic behavior.

To debug issues in priorities or to see what's going on in the background you can use the `/opt/vyatta/sbin/priority.pl` script which lists to you the execution order of the scripts.

One of the major advantages introduced in VyOS 1.3 is an automated test framework. When assembling an ISO image multiple things can go wrong badly and publishing a faulty ISO makes no sense. The user is disappointed by the quality of the image and the developers get flooded with bug reports over and over again.

Da die VyOS-Dokumentation nicht nur für die Benutzer, sondern auch für die Entwickler gedacht ist - und wir keine geheime Dokumentation führen - wird in diesem Abschnitt beschrieben, wie das automatische Testen funktioniert.

## 19.1 Jenkins CI

Our [VyOS CI](#) system is based on Jenkins and builds all our required packages for VyOS 1.2 to 1.4. In addition to the package build, there is the `vyos-build` Job which builds and tests the VyOS ISO image which is published after a successful test drive.

We differentiate in two independent tests, which are both run in parallel by two separate QEmu instances which are launched via `make test` and `make testc` from within the [vyos-build](#) repository.

## 19.2 Smoketests

Smoketests executes predefined VyOS CLI commands and checks if the desired daemon/service configuration is rendered - that is how to put it „short“.

When an ISO image is assembled by the [VyOS CI](#), the `BUILD_SMOKETEST` parameter is enabled by default, which will extend the ISO configuration line with the following packages:

```
def CUSTOM_PACKAGES = ''
  if (params.BUILD_SMOKETESTS)
    CUSTOM_PACKAGES = '--custom-package vyos-1x-smoketest'
```

So if you plan to build your own custom ISO image and want to make use of our smoketests, ensure that you have the `vyos-1x-smoketest` package installed.

The `make test` command from the `vyos-build` repository will launch a new QEmu instance and the ISO image is first installed to the virtual harddisk.

Nach dem ersten Start des neu installierten Systems wird das Smoketest-Hauptskript ausgeführt, das hier zu finden ist: `/usr/bin/vyos-smoketest`

The script only searches for executable „test-cases“ under `/usr/libexec/vyos/tests/smoke/cli/` and executes them one by one.

---

**Bemerkung:** Da Smoketests die Systemkonfiguration ändern und Sie aus der Ferne eingeloggt sind, kann es sein, dass Sie die Verbindung zum System verlieren.

---

---

**Bemerkung:** To enable smoketest debugging (print of the CLI set commands used) you can run: `touch /tmp/vyos.smoketest.debug`.

---

### 19.2.1 Manual Smoketest Run

On the other hand - as each test is contain in its own file - one can always execute a single Smoketest by hand by simply running the Python test scripts.

Example:

```
vyos@vyos:~$ /usr/libexec/vyos/tests/smoke/cli/test_protocols_bgp.py
test_bgp_01_simple (__main__.TestProtocolsBGP) ... ok
test_bgp_02_neighbors (__main__.TestProtocolsBGP) ... ok
test_bgp_03_peer_groups (__main__.TestProtocolsBGP) ... ok
test_bgp_04_afi_ipv4 (__main__.TestProtocolsBGP) ... ok
test_bgp_05_afi_ipv6 (__main__.TestProtocolsBGP) ... ok
test_bgp_06_listen_range (__main__.TestProtocolsBGP) ... ok
test_bgp_07_l2vpn_evpn (__main__.TestProtocolsBGP) ... ok
test_bgp_08_zebra_route_map (__main__.TestProtocolsBGP) ... ok
test_bgp_09_distance_and_flowspec (__main__.TestProtocolsBGP) ... ok
test_bgp_10_vrf_simple (__main__.TestProtocolsBGP) ... ok
test_bgp_11_confederation (__main__.TestProtocolsBGP) ... ok
test_bgp_12_v6_link_local (__main__.TestProtocolsBGP) ... ok
test_bgp_13_solo (__main__.TestProtocolsBGP) ... ok
```

```
-----
Ran 13 tests in 348.191s
```

```
OK
```

## 19.2.2 Interface based tests

Our smoketests not only test daemons and services, but also check if what we configure for an interface works. Thus there is a common base class named: `base_interfaces_test.py` which holds all the common code that an interface supports and is tested.

Those common tests consists out of:

- Eine oder mehrere IP-Adressen hinzufügen
- DHCP-Client und DHCPv6-Präfix-Delegation
- MTU size
- IP- und IPv6-Optionen
- Port description
- Port disable
- VLANs (QinQ and regular 802.1q)
- ...

**Bemerkung:** When you are working on interface configuration and you also want to test if the Smoketests pass you would normally loose the remote SSH connection to your DUT (Device Under Test). To handle this issue, some of the interface based tests can be called with an environment variable beforehand to limit the number of interfaces used in the test. By default all interface e.g. all Ethernet interfaces are used.

```
vyos@vyos:~$ TEST_ETH="eth1 eth2" /usr/libexec/vyos/tests/smoke/cli/test_interfaces_
↳ bonding.py
test_add_multiple_ip_addresses (__main__.BondingInterfaceTest) ... ok
test_add_single_ip_address (__main__.BondingInterfaceTest) ... ok
test_bonding_hash_policy (__main__.BondingInterfaceTest) ... ok
test_bonding_lacp_rate (__main__.BondingInterfaceTest) ... ok
test_bonding_min_links (__main__.BondingInterfaceTest) ... ok
test_bonding_remove_member (__main__.BondingInterfaceTest) ... ok
test_dhcpv6_client_options (__main__.BondingInterfaceTest) ... ok
test_dhcpv6pd_auto_sla_id (__main__.BondingInterfaceTest) ... ok
test_dhcpv6pd_manual_sla_id (__main__.BondingInterfaceTest) ... ok
test_interface_description (__main__.BondingInterfaceTest) ... ok
test_interface_disable (__main__.BondingInterfaceTest) ... ok
test_interface_ip_options (__main__.BondingInterfaceTest) ... ok
test_interface_ipv6_options (__main__.BondingInterfaceTest) ... ok
test_interface_mtu (__main__.BondingInterfaceTest) ... ok
test_ipv6_link_local_address (__main__.BondingInterfaceTest) ... ok
test_mtu_1200_no_ipv6_interface (__main__.BondingInterfaceTest) ... ok
test_span_mirror (__main__.BondingInterfaceTest) ... ok
test_vif_8021q_interfaces (__main__.BondingInterfaceTest) ... ok
test_vif_8021q_lower_up_down (__main__.BondingInterfaceTest) ... ok
test_vif_8021q_mtu_limits (__main__.BondingInterfaceTest) ... ok
test_vif_8021q_qos_change (__main__.BondingInterfaceTest) ... ok
test_vif_s_8021ad_vlan_interfaces (__main__.BondingInterfaceTest) ... ok
test_vif_s_protocol_change (__main__.BondingInterfaceTest) ... ok
```

(Fortsetzung auf der nächsten Seite)

(Fortsetzung der vorherigen Seite)

```
Ran 23 tests in 244.694s
```

```
OK
```

This will limit the *bond* interface test to only make use of *eth1* and *eth2* as member ports.

## 19.3 Last Tests der Konfiguration

The other part of our tests are called „config load tests“. The config load tests will load - one after another - arbitrary configuration files to test if the configuration migration scripts work as designed and that a given set of functionality still can be loaded with a fresh VyOS ISO image.

The configurations are all derived from production systems and can not only act as a testcase but also as reference if one wants to enable a certain feature. The configurations can be found here: <https://github.com/vyos/vyos-1x/tree/current/smoketest/configs>

The entire test is controlled by the main wrapper script `/usr/bin/vyos-configtest` which behaves in the same way as the main smoketest script. It scans the folder for potential configuration files and issues a load command one after another.

### 19.3.1 Manual config load test

One is not bound to load all configurations one after another but can also load individual test configurations on his own.

```
vyos@vyos:~$ configure
load[edit]

vyos@vyos# load /usr/libexec/vyos/tests/config/ospf-small
Loading configuration from '/usr/libexec/vyos/tests/config/ospf-small'
Load complete. Use 'commit' to make changes effective.
[edit]
vyos@vyos# compare
[edit interfaces ethernet eth0]
-hw-id 00:50:56:bf:c5:6d
[edit interfaces ethernet eth1]
+duplex auto
-hw-id 00:50:56:b3:38:c5
+speed auto
[edit interfaces]
-ethernet eth2 {
-   hw-id 00:50:56:b3:9c:1d
-}
-vti vti1 {
-   address 192.0.2.1/30
-}
...

vyos@vyos# commit
vyos@vyos#
```

---

**Bemerkung:** Some of the configurations have preconditions which need to be met. Those most likely include generation of cryptographic keys before the config can be applied - you will get a commit error otherwise. If you are interested how those preconditions are fulfilled check the [vyos-build](#) repository and the `scripts/check-qemu-install` file.

---

---

## Write Documentation

---

We encourage every VyOS user to help us improve our documentation as we have a deficit like most software projects. This not only helps you when reading but also everyone else.

If you are willing to contribute to our documentation this is the definite guide how to do so.

---

**Bemerkung:** In contrast to submitting code patches, there is no requirement that you open up a [Phabricator](#) task prior to submitting a Pull-Request to the documentation.

---

VyOS documentation is written in reStructuredText and generated to Read the Docs pages with Sphinx, as per the Python tradition. We welcome all sorts of contributions to the documentation. Not just new additions but also corrections to existing documentation.

The documentation source is kept in the Git repository at <https://github.com/vyos/vyos-documentation> and you can follow the instructions in the [README.md](#) to build and test your changes.

You can either install Sphinx and build the documentation locally, or use the [Dockerfile](#) to build it in a container.

## 20.1 Guidelines

There are a few things to keep in mind when contributing to the documentation, for the sake of consistency and readability.

The following is a quick summary of the rules:

- Use American English at all times. It's always a good idea to run your text through a grammar and spell checker, such as [Grammarly](#).
- Don't forget to update `index.rst` when adding a new node.
- Try not to exceed 80 characters per line, but don't break URLs over this.
- Properly quote commands, filenames and brief code snippets with double backticks.
- Use literal blocks for longer snippets.

- Leave a newline before and after a header.
- Indent with two spaces.
- When in doubt, follow the style of existing documentation.

And finally, remember that the reStructuredText files aren't exclusively for generating HTML and PDF. They should be human-readable and easily perused from a console.

## 20.2 Page content

All RST files must follow the same TOC Level syntax and have to start with

```
#####  
Title  
#####
```

The configuration mode folder and the articles cover the specific level of the commands. The exact level depends on the command. This should provide stability for URLs used in the forum or blogpost.

For example:

- `set firewall zone` is written in `firewall/zone.rst`
- `set interfaces ethernet` is written in `interfaces/ethernet.rst`

In the configuration part of the page, all possible configuration options should be documented. Use `.. cfgcmd::` described above.

Related operation command must be documented in the next part of the article. Use `: :opcmd..` for these commands.

Each page must contain the following parts:

### 20.2.1 1. Theoretical information

Theoretical information required for users to understand the next document sections:

- a simple explanation of what is this page about, why or when it is required to be used
- references to standards, RFCs

### 20.2.2 2. Configuration description

Describe CLI items related to the service or use case. Each config line or section must be explained, using information provided in the 1st part of the page.

### 20.2.3 3. Configuration examples

Practical examples of the service or use case configuration. They must contain topology maps (if applicable) and short descriptions.

### 20.2.4 4. Known issues

This section must contain a list of:

- known issues or potential problems for the service or use case
- workarounds for known issues (if any exist)

### 20.2.5 5. Debugging

Described procedures for debugging a service:

- how to collect logs or other debugging information (like *show* commands output)
- how to read and what to search for in logs and collected information
- what are indicators of good and bad states in debugging outputs

## 20.3 Style Guide

### 20.3.1 Formatting and Sphinxmarkup

#### TOC Level

We use the following syntax for Headlines.

```
#####
Title
#####

*****
Chapters
*****

Sections
=====

Subsections
-----

Subsubsections
^^^^^^^^^^^^^^^^

Paragraphs
.....
```

## Cross-References

A plugin will be used to generate a reference label for each headline. To reference a page or a section in the documentation use the `:ref:` command.

For example, you want to reference the headline **VLAN** in the **ethernet.rst** page. The plugin generates the label based on the headline and the file path.

```
:ref:`configuration/interfaces/ethernet:vlan`
```

to use an alternative hyperlink use it this way:

```
:ref:`Check out VLAN<configuration/interfaces/ethernet:vlan>`
```

## handle build errors

The plugin will warn on build if a headline has a duplicate name in the same document. To prevent this warning, you have to put a custom link on top of the headline.

```
Section A
=====

Lorem ipsum dolor sit amet, consetetur sadipscing elitr

Example
-----

Lorem ipsum dolor sit amet, consetetur sadipscing elitr

Section B
=====

Lorem ipsum dolor sit amet, consetetur sadipscing elitr

.. _section B example:

Example
-----

Lorem ipsum dolor sit amet, consetetur sadipscing elitr
```

## Address space

Note the following RFCs ([RFC 5737](#), [RFC 3849](#), [RFC 5389](#) and [RFC 7042](#)), which describe the reserved public IP addresses and autonomous system numbers for the documentation:

- 192.0.2.0/24
- 198.51.100.0/24
- 203.0.113.0/24
- 2001:db8::/32
- 16bit ASN: 64496 - 64511
- 32bit ASN: 65536 - 65551

- Unicast MAC Addresses: 00-53-00 to 00-53-FF
- Multicast MAC-Addresses: 90-10-00 to 90-10-FF

Please do not use other public address space.

## Line length

Limit all lines to a maximum of 80 characters.

Except in `.. code-block::` because it uses the html tag `<pre>` and renders the same line format from the source rst file.

## Autolinter

Each GitHub pull request is automatically linted to check the address space and line length.

Sometimes it is necessary to provide real IP addresses like in the *Configuration Blueprints*. For this, please use the sphinx comment syntax `.. stop_vyoslint` to stop the linter and `.. start_vyoslint` to start.

## Custom Sphinx-doc Markup

Custom commands have been developed for writing the documentation. Please make yourself comfortable with those commands as this eases the way we render the documentation.

### cfgcmd

When documenting CLI commands, use the `.. cfgcmd::` directive for all configuration mode commands. An explanation of the described command should be added below this statement. Replace all variable contents with `<value>` or something similar.

With those custom commands, it will be possible to render them in a more descriptive way in the resulting HTML/PDF manual.

```
.. cfgcmd:: protocols static arp <ipaddress> hwaddr <macaddress>
```

This will configure a static ARP entry, always resolving ``192.0.2.100`` to ``00:53:27:de:23:aa``.

For an inline configuration level command, use `:cfgcmd:`

```
:cfgcmd:`set interface ethernet eth0`
```

To extract a defaultvalue from the XML definitions add a `:defaultvalue:` to `.. cfgcmd::` directive. To have this feature locally, the `vyos-lx` submodule must be initialized before. Please be aware to not update the submodule in your PR.

```
.. cfgcmd:: set system conntrack table-size <1-500000000>
:defaultvalue:
```

The connection tracking table contains one entry for each connection being tracked by the system.

## opcmd

When documenting operational level commands, use the `.. opcmd::` directive. An explanation of the described command should be added below this statement.

With those custom commands, it is possible to render them in a more descriptive way in the resulting HTML/PDF manual.

```
.. opcmd:: show protocols static arp
```

Display all known ARP table entries spanning across all interfaces

For an inline operational level command, use `:opcmd:`

```
:opcmd:`add system image`
```

## cmdinclude

To minimize redundancy, there is a special include directive. It includes a txt file and replace the `{{ var0 }}` - `{{ var9 }}` with the correct value.

```
.. cmdinclude:: ../include/interface-address.txt
:var0: ethernet
:var1: eth1
```

the content of interface-address.txt looks like this

```
.. cfgcmd:: set interfaces {{ var0 }} <interface> address <address | dhcp |
dhcpv6>
```

Configure interface ``<interface>`` with one or more interface addresses.

\* **\*\*address\*\*** can be specified multiple times as IPv4 and/or IPv6 address, e.g. 192.0.2.1/24 and/or 2001:db8::1/64  
 \* **\*\*dhcp\*\*** interface address is received by DHCP from a DHCP server on this segment.  
 \* **\*\*dhcpv6\*\*** interface address is received by DHCPv6 from a DHCPv6 server on this segment.

Example:

```
.. code-block:: none
```

```
set interfaces {{ var0 }} {{ var1 }} address 192.0.2.1/24
set interfaces {{ var0 }} {{ var1 }} address 192.0.2.2/24
set interfaces {{ var0 }} {{ var1 }} address 2001:db8::ffff/64
set interfaces {{ var0 }} {{ var1 }} address 2001:db8:100::ffff/64
```

## vytask

When referencing to VyOS Phabricator Tasks, there is a custom Sphinx Markup command called `vytask` that automatically renders to a proper Phabricator URL. This is heavily used in the [Changelog](#) section.

```
* :vytask:`T1605` Fixed regression in L2TP/IPsec server
* :vytask:`T1613` Netflow/sFlow captures IPv6 traffic correctly
```

## 20.4 Forking Workflow

The Forking Workflow is fundamentally different from other popular Git workflows. Instead of using a single server-side repository to act as the „central“ codebase, it gives every developer their own server-side repository. This means that each contributor has not one, but two Git repositories: a private local one and a public server-side one.

The main advantage of the Forking Workflow is that contributions can be integrated without the need for everybody to push to a single central repository. Developers push to their own server-side repositories, and only the project maintainer can push to the official repository. This allows the maintainer to accept commits from any developer without giving them write access to the official codebase.

---

**Bemerkung:** Updates to our documentation should be delivered by a GitHub pull-request. This requires you already have a GitHub account.

---

- Fork this project on GitHub <https://github.com/vyos/vyos-documentation/fork>
- Clone fork to local machine, then change to that directory `$ cd vyos-documentation`
- Install the requirements `$ pip install -r requirements.txt` (or something similar)
- Create a new branch for your work, use a descriptive name of your work: `$ git checkout -b <branch-name>`
- Make all your changes - please keep our commit rules in mind ([Prepare patch/commit](#)). This mainly applies to proper commit messages describing your change (how and why). Please check out the documentation of [Sphinx-doc](#) or [reStructuredText](#) if you are not familiar with it. This is used for writing our docs. Additional directives how to write in RST can be obtained from [reStructuredTextDirectives](#).
- Check your changes by locally building the documentation `$ make livehtml`. Sphinx will build the html files in the docs/\_build folder. We provide you with a Docker container for an easy-to-use user experience. Check the [README.md](#) file of this repository.
- View modified files by calling `$ git status`. You will get an overview of all files modified by you. You can add individual files to the Git Index in the next step.
- Add modified files to Git index `$ git add path/to/filename` or add all unstaged files `$ git add ..` All files added to the Git index will be part of you following Git commit.
- Commit your changes with the message, `$ git commit -m "<commit message>"` or use `$ git commit -v` to have your configured editor launched. You can type in a commit message. Again please make yourself comfortable without rules ([Prepare patch/commit](#)).
- Push commits to your GitHub project: `$ git push -u origin <branch-name>`
- Submit pull-request. In GitHub visit the main repository and you should see a banner suggesting to make a pull request. Fill out the form and describe what you do.
- Once pull requests have been approved, you may want to locally update your forked repository too. First you'll have to add a second remote called *upstream* which points to our main repository. `$ git remote add upstream https://github.com/vyos/vyos-documentation.git`

Check your configured remote repositories:

```
$ git remote -v
origin    https://github.com/<username>/vyos-documentation.git (fetch)
origin    https://github.com/<username>/vyos.documentation.git (push)
upstream  https://github.com/vyos/vyos-documentation.git (fetch)
upstream  https://github.com/vyos/vyos-documentation.git (push)
```

Your remote repo on Github is called `origin`, while the original repo you have forked is called `upstream`. Now you can locally update your forked repo.

```
$ git fetch upstream
$ git checkout current
$ git merge upstream/current
```

- If you also want to update your fork on GitHub, use the following: `$ git push origin current`

---

## Coverage

---

Overview over all commands, which are documented in the `.. cfgcmd::` or `.. opcmd::` Directives.

The build process take all xml definition files from `vyos-1x` and a periodical export of all VyOS commands and extract each leaf command or executable command. After this the commands are compare and shown in the following two tables. The script compare only the fixed part of a command. All variables or values will be erase and then compare:

for example there are these two commands:

- documentation: `interfaces ethernet <interface> address <address | dhcp | dhcpv6>`
- xml: `interfaces ethernet <ethernet> address <address>`
- VyOS: `interfaces ethernet <text> address <value>`

Now the script erase all in between `<` and `>` and simply compare the strings.

**There are 3 kind of problems:**

Not documented yet

- A XML command are not found in `.. cfgcmd::` or `.. opcmd::` Commands
- The command should be documented

Nothing found in XML Definitions

- `.. cfgcmd::` or `.. opcmd::` Command are not found in a XML command
- Maybe the command where changed in the XML Definition, the feature is not anymore in VyOS, or there is a typo

Nothing found in VyOS

- `.. cfgcmd::` or `.. opcmd::` Command are not found in a VyOS command
- Maybe the command where changed, the feature is not anymore in VyOS, or there is a typo

## 21.1 Configuration Commands
